## Non-technical summary

This Basement Impact Assessment (BIA) report has been prepared by Ove Arup and Partners Ltd (Arup) on behalf of British Land Property Management Limited in support of a planning application (ref. 23/5240/P) at Euston Tower, 286 Euston Road, London NW1 3DP, submitted in December 2023.

The Applicant has undertaken extensive consultation during both the pre-application and determination stages and has sought to respond positively to the responses received. The scheme has been revised in response to feedback from Officers, local stakeholders and residents, including the Regents Park Conservation Area Advisory Committee and statutory consultees, including Historic England and The Greater London Authority.

This BIA report has been revised to incorporate revisions to the pending scheme (the "Proposed Development") and supersedes the previous revisions. Ground movement and impact assessments on neighbouring buildings have been updated in this BIA report following changes to proposed building massing, B1 slab lowering, Basement 02 geometry and new foundations.

The Description of Development for the Proposed Development, in light of the 2024 Revisions, has been updated to the following:

"Redevelopment of Euston Tower comprising retention of parts of the existing building (including central core, basement and foundations) and erection of a new building incorporating these retained elements, to provide a 32-storey mixed-use building providing offices and research and development floorspace (Class E(g)) and office, retail, café and restaurant space (Class E) and Enterprise space (Class E/F) at ground and first floors, and associated external terraces; public realm enhancements, including new landscaping and provision of new publicly accessible steps and ramp; short and long stay cycle storage; servicing; refuse storage; plant and other ancillary and associated work."

A new steel structural frame and new floorplates will be constructed, with the foundations and central core being reused. New supplementary foundations will be constructed to support the new superstructure where it extends beyond the extent of the existing piled raft. A local Basement 02 level is proposed underneath the existing single level basement to accommodate a water tank and plant room. The proposed local Basement 02 level has a plan dimension of approximately  $5.5m \times 34m (187 \text{ sqm})$ , located to the west of existing pinwheel piled raft. The proposed B2 FFL is approximately +19.77mOD in relation to the general single level basement level of +23.9mOD.

The assessment presented in this BIA report is based on guidance provided in the following documents (listed in hierarchy order):

- Camden Local Plan Policy A5 'Basements' (Camden 2017).
- Camden Planning Guidance (CPG) on Basements (Camden, 2021); and
- Camden geological, hydrogeological, and hydrological study. Guidance for subterranean development (Camden, 2010).

A screening assessment has been carried out in accordance with Camden geological, hydrogeological, and hydrological study. Guidance for subterranean development (Camden, 2010). It is concluded that the proposed development is unlikely to result in any groundwater or surface water issues. This basement impact assessment complies with the requirements of the Camden Local Plan - Policy A5 'Basements' (Camden, 2017) and the latest Camden Planning Guidance on Basements (Camden 2021).

Preliminary ground movement assessment carried out in this report indicated that the neighbouring 1 Triton Square and 2 Triton Square do not fall within the zone of influence for ground movements associated with the proposed development. The southern façade of neighbouring North East Quadrant (10-30 Brock Street) falls within the zone of influence. However, the potential impact of the long-term settlements on 10-30 Brock Street is calculated to fall within damage category 0 'negligible' on the Burland scale. This does not exceed category 1 'very slight' on the Burland scale and is compliant with Camden Planning Guidance (CPG) on Basements (Camden, 2021).

The previous version of this BIA report has undergone audit process (see CampbellReith Basement Impact Assessment Audit, Report ref.: SSkb14006-59-230424-Euston Tower\_D1, 2024). In response to comments raised, a technical note was prepared (see Arup Basement Impact Assessment Audit [2023/5240/P] File Note, Ref: 281835-07, 2024).

A comparison of the previous and current basement impact assessment results is summarised in Section 7. There is a small reduction in long term settlements calculated for neighbouring 10-30 Brock Street. The Burland damage category calculated is unchanged at damage category 0 'negligible' on the Burland scale.

The site falls within the 2015 Crossrail 2 Safeguarding Directions and is located to the west of Northern and Victoria line tunnels, to the north of St Johns Wood to Back Hill deep cable tunnel and Hammersmith & City, Circle and Metropolitan line tunnel). Third party consultation and engagement with the respective asset owners is in progress. Ground movement assessments will be carried out in separate standalone technical assessments for review by the respective third parties ahead of the proposed development as required.

## 1. Introduction

Ove Arup and Partners Ltd (Arup) have been commissioned by British Land Property Management Limited to carry out a Basement Impact Assessment to support the planning application (ref. 23/5240/P) at Euston Tower, 286 Euston Road, London NW1 3DP, submitted in December 2023.

The Applicant has undertaken extensive consultation during both the pre-application and determination stages of the Proposed Development and has sought to respond positively to the responses received. The scheme has been revised in response to feedback from Officers, local stakeholders and residents, including the Regents Park Conservation Area Advisory Committee and statutory consultees, including Historic England and The Greater London Authority.

This BIA report has been revised to incorporate revisions to the pending scheme (the "Proposed Development") and supersedes the previous revisions. Ground movement and impact assessments on neighbouring buildings have been updated in this BIA report following changes to proposed building massing, B1 slab lowering, Basement 02 geometry and new foundations.

Euston Tower is the last largely unaltered building constructed as part of the Euston Centre estate for developer DE & J Levy between the years 1962-1972. The estate was designed by architect Sidney Kaye, Eric Firmin & Partners, and the structural engineer for the tower was John De Bremaeker & Partners who are believed to have designed both the sub and super-structure. The Euston tower superstructure was constructed by contractor George Wimpey between approximately 1965 and 1970; it is unclear whether they also constructed the substructure and foundations. The podium was refurbished at the turn of the millennium by architects Sheppard Robson with structural engineers Arup.

The proposed development comprises redevelopment of Euston Tower, including the retention of parts of the existing building (including central core, basement and foundations) and erection of a new building incorporating these retained elements, to provide a 32-storey mixed-use building providing offices and research and development floorspace (Class E(g)) and office, retail, café and restaurant space (Class E) and Enterprise space (Class E/F) at ground and first floors, and associated external terraces; public realm enhancements, including new landscaping, and provision of new publicly accessible steps and ramp; short and long stay cycle storage; servicing; refuse storage; plant and other ancillary and associated works.

A new steel structural frame and new floorplates will be constructed, with the foundations and central core being reused. New supplementary foundations will be constructed to support the new superstructure where it extends beyond the extent of the existing piled raft. A local Basement 02 level is proposed underneath the existing single level basement to accommodate a water tank and plant room. The proposed local Basement 02 level has a plan dimension of approximately  $5.5m \times 34m (187 \text{ sqm})$ , located to the west of existing pinwheel piled raft. The proposed B2 FFL is approximately +19.77mOD in relation to the general 1 level basement level of +23.9mOD.

The assessment presented in this report is based on guidance provided in the following documents (listed in hierarchy order):

- Camden Local Plan Policy A5 'Basements' (Camden 2017);
- Camden Planning Guidance (CPG) on Basements (Camden, 2021); and
- Camden geological, hydrogeological and hydrological study. Guidance for subterranean development (Camden, 2010).

This BIA report is prepared by Arup as structural/ geotechnical and services designer of the proposed development. The report has been prepared or checked by a Chartered Civil Engineer (member of the Institution of Civil Engineers) and approved by a Chartered Civil Engineer (Fellow of the Institution of Civil Engineers.)

## 2. The site

#### 2.1 Site location

Euston Tower (the site) is situated within the London Borough of Camden and the ward of Regent's Park. The site is bounded by Euston Road (south), Hampstead Road (east), Brock Street (north) and Regent's Place (west). The site covers an area of 7,963sqm, comprised of a single, ground plus an existing 36-storey tower. The tower has been largely vacant for several years, predominantly comprising office uses on the upper floors, however there are still retail uses currently in operation at ground floor level.

The site does not fall within a conservation area (CA); however, Fitzroy Square CA and Bloomsbury CA are both located in close proximity (south). There are no elements of the site that are statutory or locally listed. A Certificate of Immunity from listing has been submitted and at the time of submission is still pending in respect of the existing tower. There are several buildings located within a close radius of the site that are Grade I, Grade II, and Grade II\* listed. The site has a PTAL rating of 6b indicating 'excellent' transport connectivity. The site is mainly served by Watten Street Underground Station (south), Euston Square Underground Station (east) and Great Portland Street Underground Station (west). There are also several bus routes that serve the site along Euston Road (south) and Hampstead Road (east).

The land surrounding the site consists of a range of uses. The site is designated within the Knowledge Quarter Innovation District (KQID), home to world-class clusters of scientific and knowledge-based institutions and companies specialising in life-sciences, data and technology and creative industries. The neighbouring Regents' Place comprises commercial, office and cultural land uses, as well as pedestrianised streets and public realm incorporated into the space. The closest residential properties are located along Drummond Street (north) and Hampstead Road (east).

The building is part of the mixed-use Regent's Place Estate, currently managed by British Land, as shown in Figure 1.

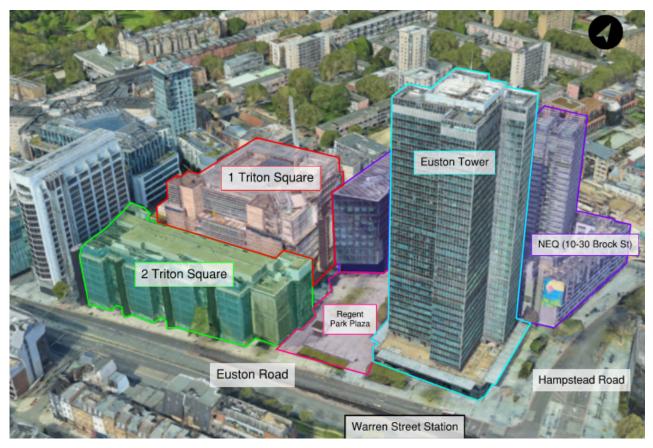

Figure 1: Site location plan (Google Earth, 2022)

#### 2.2 Existing Euston Tower

Euston Tower is a 36-storey tall building standing on the northern edge of central London, situated in the south-west of the London Borough of Camden.

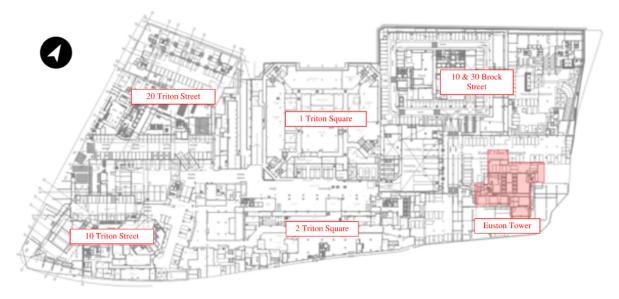

Located on the corner of Euston and Hampstead Road, at the top of Tottenham Court Road, the tower shares a busy intersection with the UCL Hospital campus and is directly opposite Warren Street Station. The current tower has a prominent presence, given its status as the tallest building in the borough aside from the nearby BT Tower, and as such acts as a physical landmark for London Euston, Euston Square and Warren Street stations as well as wayfinding for the wider neighbourhood.

Completed in 1970, Euston Tower is designed in the 'International Style'. Above a two-storey extruded glazed podium, the tower has a pinwheel plan clad in aluminium curtain walling with green reflective tinted glazing. It was designed as an office building to provide cellular office accommodation typical of the period and formed part of a wider masterplan known as The Euston Centre. It now stands on the eastern edge of the pedestrianised Regent's Place Estate.

Since its completion, the Euston Tower has undergone a small refurbishment, but beyond this its external form and façade remain as originally constructed. These elements of the building are in a generally poor condition, due to a combination of wear in use and the quality of the original detailing. Gradually it has been vacated, and since 2021, except for the retail at grade level, the building is entirely disused.

There is a large single-storey shared basement across Regents Place Estate, which is bounded by Drummond Street to the north, Hampstead Road to the East, Euston Road to the South and by Osnaburg Street to the west. Euston Tower is located in the southeast corner as indicated in Figure 2.

The basement will be retained as part of the new works. Reference can be made to the Structural Report (Arup, 2023) contained within the planning application for further details on the existing building structure and proposed modifications.

#### 2.3 Site history

A geotechnical desk study has been carried out to determine the historical development of the site. Sources of information reviewed as part of the desk study are summarised as below:

- Envirocheck site history search.
- Historical Ordnance Survey mapping.
- Aerial/historic image searches.

- Publicly available information regarding tunnels including safeguarded alignments.
- Available drawings and reports from Arup project archives and those received from British Land.
- Historical maps, records, and fire insurance plans (Goad plans).
- Enquiries with parties involved with the original Euston Tower construction (or successors); and
- Archive searches for Euston Tower.

The historical development of the site is briefly summarised in Table 1. Based on available information, Euston Tower is understood to have different commercial uses in the past. Some notable previous uses include Capital Radio broadcasting centre and government communications centre.

Year	Historical developments
c.1746	Greenfield. The site is not developed.
c. 1813	First development of the site with the majority of site being covered by terraced buildings. By 1989, the properties comprised shops, a pawnbroker, and vacant three-storey terrace buildings with single level basements in the south.
c. 1936	The vacant properties in the south are now occupied with a surgical instrument factory, a sign factory, and a toilet requisite factory.
c. 1957	A sheet metal works now occupies most of the southern plots with miscellaneous shops and units occupying the north.
c. 1963	Clearance of the southern area of site (Euston Road to Eden Street).
c. 1966	Construction of Euston Road/ Hampstead Road underpass (south of Euston Tower).
c. 1966- 1970	Euston Centre development. Construction of Euston Tower (then known as Euston Centre Block A), comprising the existing 36-storey concrete framed tower with two-level podium and a single level basement carpark (common level basement, spanning across the site).
c. 1971	Euston Tower completed.
c. Late 1960s/ early 1970s	Construction of Euston Centre Block F immediately to the west of Euston Tower (Euston Centre Block A)
c. 1972- 1974	Construction of buildings to the north of Euston Tower, 10-30 Brock Street.
c. 1990s	Demolition of 2 Triton Square area, including the connecting two-storey podium structure, in early-mid 90s, current adjacent building completed by 2006.
c. 2010- 2012	Demolition and construction of buildings to the north of Euston Tower (Northeast Quadrant 10-30 Brock St).

#### 2.4 Topography

The ground level public realm across the site footprint is relatively flat at approximately +28.0 metres above Ordnance Datum (mOD) as shown in the Plowman Craven topographic survey dated June 2018. The drawings are included in Appendix A.

The single level basement slab level at the site is typically around +23.9mOD SSL or 4.1 metres below ground level (mbgl). Towards 1 Triton Square situated west of the site, the basement slab level drops down to approximately +21.7mOD via a step, to allow access for larger service vehicles via a loading bay.

#### 2.5 Neighbouring buildings and assessment methodology

Camden Planning Guidance (CPG) on Basements (Camden, 2021) states that the anticipated damage category for neighbouring structures should not exceed category 1 'very slight' on the Burland scale. The Burland assessment methodology referenced in the CPG has been adopted for projects internationally and has been used by the Building Research Establishment and the Institution of Structural Engineers, London.

The classification system is based on the ease of repair of potential damage. Burland Scale categories 0 ('negligible'), 1 ('very slight'), and 2 ('slight') refer to aesthetic damage, category 3 ('moderate') and 4 ('severe') relate to serviceability and function, and 5 ('very severe') represents damage which relates to stability. Further details are provided within the CPG on Basements (Camden, 2021) guidance document.

Neighbouring structures are identified below and described in the following sections.

- 10-30 Brock Street Northeast Quadrant (NEQ)
- 1 Triton Square
- 2 Triton Square

The zone of influence for ground movements refers to the area with calculated vertical ground movements greater than +/-1mm. A screening ground movement assessment has been carried out to identify the zone of influence.

- A limited extent of the Northeast Quadrant (10-30 Brock Street) southern façade falls within the zone of influence, and is assessed in this report.
- The assessment showed that 1 Triton Square and 2 Triton Square do not fall within the zone of influence for ground movements associated with the proposed redevelopment.

For further details of the methodology for ground movement assessment, refer to Section 6 of this report.

#### 2.5.1 1 Triton Square

An eight-storey reinforced concrete frame commercial building with a single-level service basement which connects to wider basement for Euston Tower and under Regent's Park Plaza. The superstructure is located approximately 50m west from the Euston Tower superstructure. 1 Triton Square was originally developed in the early 1990s and was substantially modified to provide additional storeys by 2021.

Figure 3 shows the view of 1 Triton Square, looking west from Euston Tower.

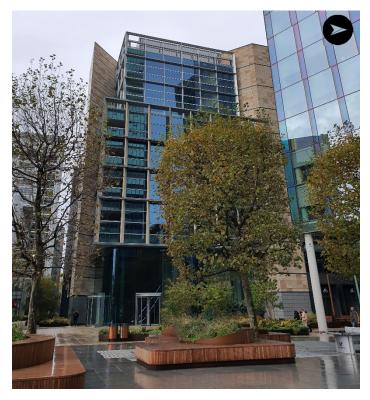

Figure 3: 1 Triton square looking west from Euston Tower (image taken 10/11/2023, Arup)

#### 2.5.2 2 Triton Square

A seven-storey concrete frame commercial building with a single level basement located southwest of Euston Tower. It is currently the head office for Santander UK. The building was completed in 2001. Figure 4 shows a view of 2 Triton Square looking west from Euston Tower.

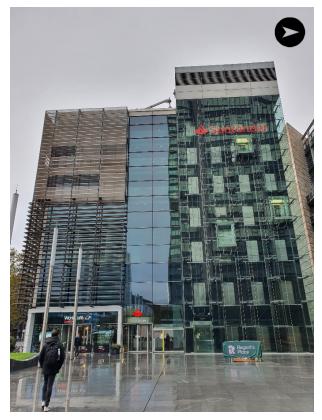

Figure 4: 2 Triton Square looking west from Euston Tower (image taken 10/11/2023, Arup)

#### 2.5.3 10-30 Brock Street - North East Quadrant (NEQ)

Situated immediately north of Euston Tower, NEQ (as shown in Figure 5) covers 10 and 20-30 Brock Street where development began in late 2000s and was completed in 2013.

- 20-30 Brock Street (The Triton Building) comprises a 26-storey residential tower with accompanying eight-storey block. 20-30 Brock Street has a double-level basement connecting to the single-level basement under Euston Tower.
- 10 Brock Street is commercial office space and comprises a part-9, part-11, and part-16 storey block. 10 Brock Street has a double-level basement which connects to the single-level basement under Euston Tower.

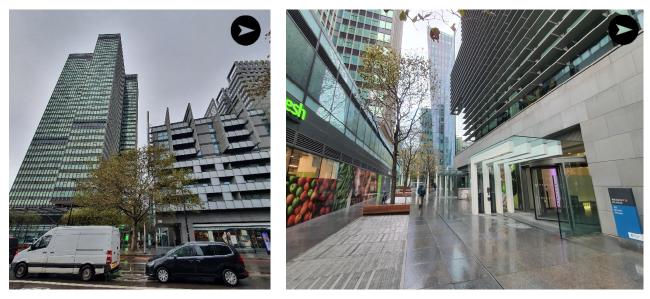

Figure 5: a) 10-30 Brock Street (North East Quadrant) looking west from Hampstead Road; b) 10-30 Brock Street pedestrian zone (images taken 10/11/2023, Arup)

#### 2.6 Neighbouring highway assets

A review of publicly owned land in immediate proximity to the site has been carried out using the "Mayor of London – Map of Publicly Owned Land" GIS web app. The map, as presented in Figure 6, indicates land owned by Transport for London to the south of the site boundary under Title number: NGL375743, including the Euston Road, highway underpass structure and the public realm. A further small parcel of land (NGL375743) is indicated to be within TfL ownership immediately adjacent to the south-east corner of the existing building.

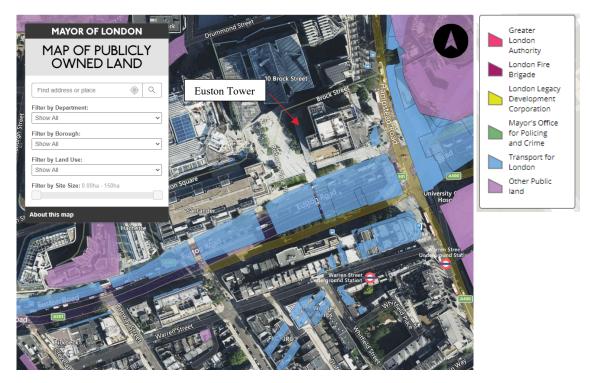

Figure 6 - Map of publicly owned land (source https://apps.london.gov.uk/public-land/ accessed 16/1/22)

The Euston Road underpass is an approximately 20m deep diaphragm wall underpass underneath the intersection with Hampstead Road and is located approximately 14m from the basement of the Euston Tower site. The underpass was constructed around 1961-1966 as part of public realm and highway improvements to dual Marylebone to Euston Road. The location is slightly to the north of the original location of Euston Road to avoid conflict with the London Underground Limited (LUL) cut and cover tunnels (Hammersmith City & Metropolitan lines) and involved demolition of Eden Street.

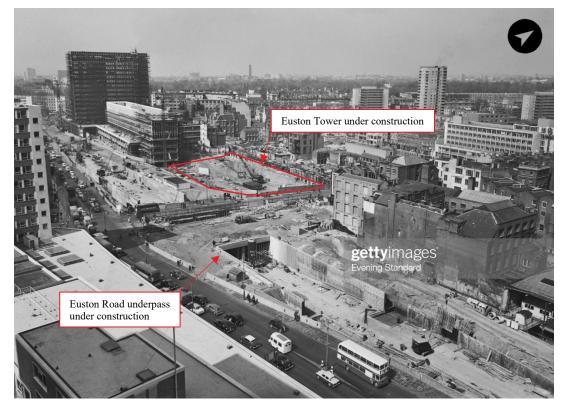

Figure 7 - Euston Road underpass under construction (Evening Standard, 1965)

Figure 8 - Euston Road Underpass under construction ~1966 Source- A London Inheritance/ London Metropolitan Archives <u>https://alondoninheritance.com/london-streets/a-lost-bank-and-the-adam-and-eve-pub-on-the-corner-of-euston-road-and-hampstead-road/attachment/eus</u>

#### 2.7 Tunnels and utilities

Various utilities are identified as present east and south of the site boundaries, as shown in the Plowman Craven topographic survey dated June 2018 (see Appendix A). A Groundwise statutory utility search was commissioned by Arup in December 2019 (Report ref. URO6731.1DM).

A summary of the assets identified is provided in Table 2. Site constraints plans showing tunnels and utilities are included in Appendix B.

The following deep tunnels have been identified in proximity to the site:

- A cable route between St Johns Wood and Back Hill runs under Euston Road west-east, approximately 6m south of the site, with a crown level at approximately +11.0mOD.
- The Northern line and Victoria line are located approximately 8m east and 31m south-east of the site respectively at track levels of approximately +1mOD (27mbgl) and -5mOD (34mbgl) respectively; and
- The Hammersmith and City, Circle & Metropolitan lines run underneath Euston Road, 37m south of the site at a track level of approximately +18mOD (10mbgl).

Table 2 - Summary of tunnels and utilities identified from statutory search.

Asset	Provider	Details
Sewers	Thames Water	Large brick sewers between 1143mmx762mm (4m south of basement, under Euston Road) and 1372mmx864mm (7m east of basement, under Hampstead Road)
Water mains	Thames Water	Water mains of trunk 18" & 8" (possibly cast-iron based on dimensions), Indicated in the search response to be at approximately 1.0m depth. Unknown pressure at the time of writing.
Electricity	UK Power Networks	Multiple cables and contain HV and LV at approximately 0.5m depth with diameter unknown along the east side on

Asset	Provider	Details
		Hampstead Road, round the corner onto Euston Road heading west.
Gas	Cadent	A low pressure (LP) main at approximately 1.3m depth mains running along the east side on Hampstead Road, round the corner onto Euston Road heading west. Diameter is 125mm polyethylene within 200mm ductile iron.
Telecommunications	BT, Colt, Instalcom Ltd, SSE, Verizon, Virgin Media, Vodafone	Indicated in the search response to be at approximately between 0.2 and 1.0m below ground level. Diameter unknown.
	LUL/Transport for London (TfL) power assets	Traffic control cables up to 0.5m depth. HV and LV track and road cables also present along Euston Road and up to Hampstead Road
Transport	London Underground lines	Victoria line Northern line Hammersmith & City, Circle & Metropolitan Line.

Figure 9 shows the location of TfL assets as identified within a statutory utility search (deep tunnels) during November 2019.

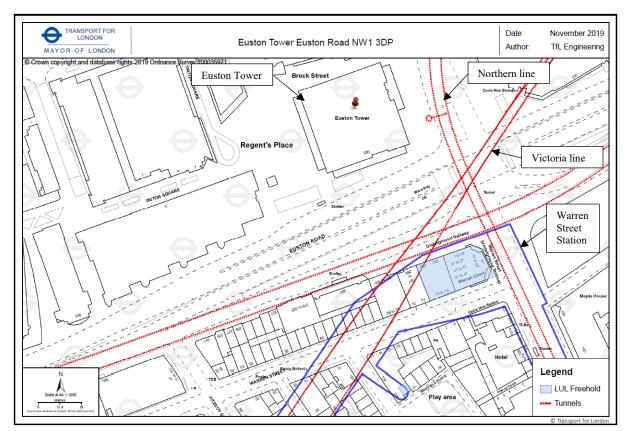

Figure 9 – TfL/LUL Statutory utility search response dated 7 November 2019, obtained via Groundwise. The location of Warren Steet station is shown in blue.

An initial meeting with the TfL Infrastructure Protection team took place on 3<sup>rd</sup> November 2023 to discuss the proposed development of Euston Tower and to seek initial feedback on the scheme proposals. TfL Infrastructure Protection team have no objection in principle to the planning application but requested

several conditions to be discharged in a phased manner as and when they are completed (see Appendix F for the TfL consultation response).

#### 2.8 Future infrastructure

The Crossrail 2 safeguarded zone provides the anticipated route of the tunnels, as well as land at ground level, that may be used for the future construction of the tunnels, station, and shafts. The safeguarded route was published in 2015 together with notes for guidance. The site location and safeguarding limits (2015) defined in the 2015 safeguarding directions are shown in Figure 10. Further details can be found at: <a href="https://crossrail2.co.uk/discover/safeguarding/">https://crossrail2.co.uk/discover/safeguarding/</a>.

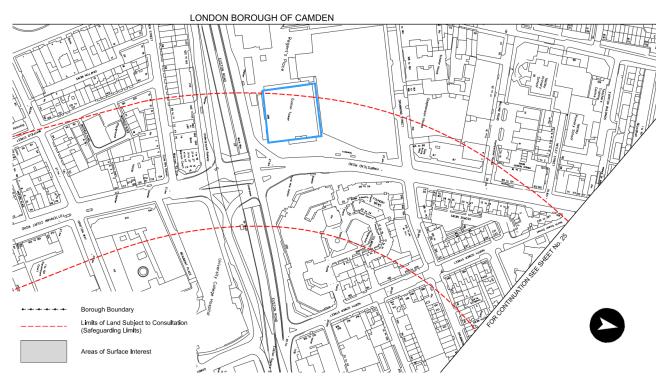

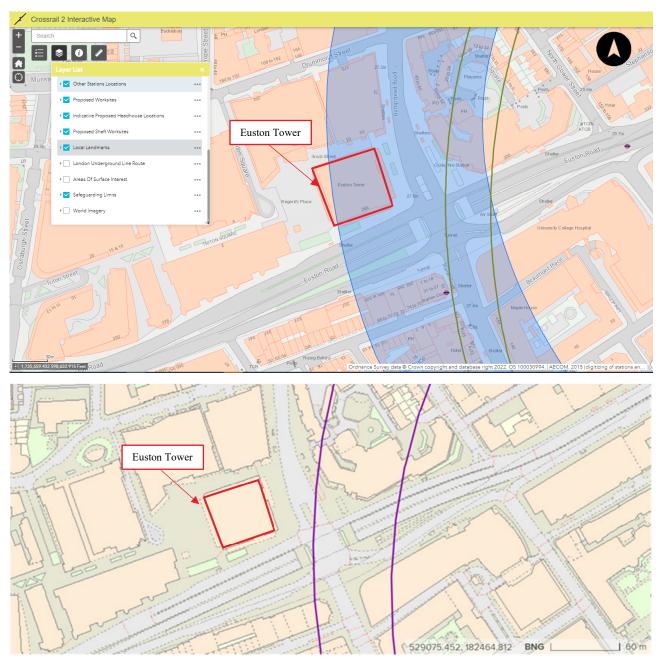

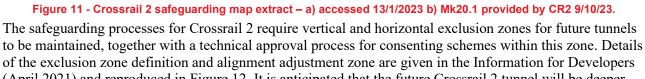

Figure 10 - Crossrail 2 safeguarding directions Sheet No24. March 2015. [MMD-307346-C-DR-SG-XX-1124]

The safeguarded limits of Crossrail 2 (2015) shown on the Crossrail 2 interactive map is shown in Figure 11a. The safeguarded limits crosses most of the Euston Tower site and the alignment is shown to cross the south-eastern corner of the junction of Euston Road and Hampstead Road. The viewer and further details can be found at the following URL:

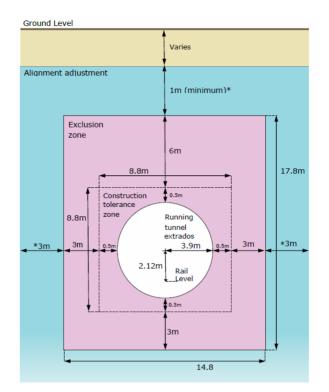

#### https://cr2.maps.arcgis.com/apps/webappviewer/index.html?id=21a7f72dfd0c443db5733bd81a707a67.

It is understood that the route alignment has evolved since the safeguarding directions were published in 2015 and the latest route alignment iteration has been requested from the Crossrail 2 Safeguarding Manager. The latest Mk20.1 alignment received from the Crossrail 2 Safeguarding Manager on 9/10/2023 is shown in Figure 11b. The proposed alignment is slightly closer to the location of Euston Tower than that shown in the publicly available webmap presented as Figure 11a, however shows that the proposed alignment is to the east of the location of Euston Tower beneath Hampstead & Euston Roads, and that the proposed development is not located within the tunnel exclusion zone or alignment adjustment zone.

(April 2021) and reproduced in Figure 12. It is anticipated that the future Crossrail 2 tunnel will be deeper than the existing London Underground lines and have a diameter of ~8m.

#### Figure 12 - Exclusion zone section from the Crossrail 2 Information for Developers, (April 2021)

As a result of future Crossrail 2 train services, there is the potential for vibrations to be transmitted to the buildings which could be re-radiated as ground borne noise within the building.

Engagement is in progress with TfL & Crossrail 2 to confirm the latest alignment proposals and to inform the subsequent design process. It is anticipated that Crossrail 2 would be a consultee to any planning application at the site. An initial meeting with the Crossrail 2 Safeguarding Manager took place on 3<sup>rd</sup> November 2023 to discuss the proposed development of Euston Tower, to confirm the principles of the safeguarding process and to determine the latest alignment information.

#### 2.9 Unexploded ordnance

Assessment for the potential of encountering unexploded ordnance is outside the remit of this report. Based on the London Metropolitan Archives bomb damage map (shown in Figure 13), the Euston area was recorded as subject of bombing during World War II with most of the site receiving blast damage. Buildings which suffered damage beyond repair and total destruction were located within the eastern portion of site and immediately to the south of the site respectively. A review of UXO risk maps provided online by Zetica indicated the site as 'high risk'.

A detailed UXO risk assessment is recommended ahead of intrusive works at the site.

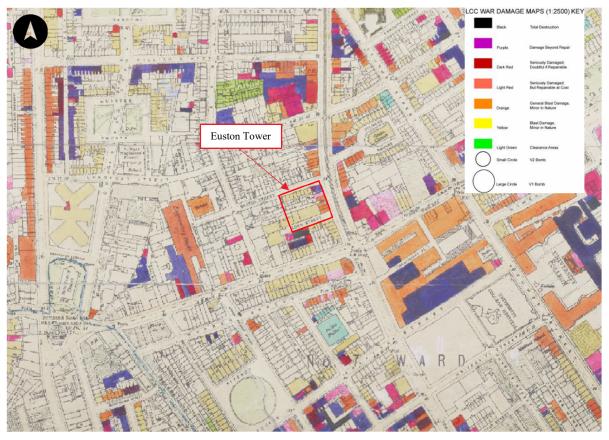

Figure 13 - Layers of London Bomb damage map from the London Metropolitan Archives webmap (https://www.layersoflondon.org/ accessed 17/01/2023)

#### 2.10 Flood risk assessment

A flood risk assessment (FRA) has been carried out by Arup relating to this application. The document assesses the flood risk at the site from various sources and presents the proposed drainage strategy for the redevelopment. For the detailed assessment please refer to the Flood Risk Assessment report (Arup, 2024, Report ref.: 281835-ARP-XX-XX-RP-CD-0001) and Flood Risk Assessment Addendum (Arup, 2024, Report ref. 281835-ARP-XX-XX-TN-CD-0001).

The key findings of the FRA are outlined as follows:

- The site is located within Flood Zone 1, an area of low probability of flooding.
- Flood risks from tidal/ fluvial sources, pluvial sources, groundwater, artificial sources, and infrastructure failure are all considered to be low.
- Considerations have been given to both risk to the site, and potential offsite risk as a result of the proposed redevelopment, in accordance with the requirements of Chapter 14 of the National Planning Policy Framework (NPPF).
- Based on current understanding of site setting and the proposals, it is considered that the redevelopment can be carried out and operated safely and would not increase flood risk elsewhere.

## 3. Ground conditions and ground model

#### 3.1 Regional geology

Published British Geological Society (BGS) 1:50,000 series solid and drift geological mapping is presented in Figure 1 of Appendix C. The superficial geology at the location of the site consists of Lynch Hill Gravel (part of the River Terrace Deposits). The outcrop of the boundary between Lynch Hill Gravel and Langley Silt ('Brickearth') is located approximately 200m to the north of the site. No indication of faults, drift-filled hollows ('scour hollows') or other distinct geological features are identified on the available mapping in the immediate vicinity of the site.

The BGS 1920s edition of the solid and drift geological map is shown in Figure 2 of Appendix C. This map does not show the outcrop of Langley Silt but shows a direct transition between the River Terrace Deposits and London Clay approximately 300m to the north of the site. Approximately 150m to the east of the site a stream or watercourse is indicated. The Lost Rivers of London by Barton (1992) was reviewed to determine the presence of former river features in proximity to the site.

Figure 3 of Appendix C presents an indicative section of the London basin from 1994 BGS 1: 50,000 series geological map, consisting of River Terrace Deposits overlying London Clay, Lambeth Group, Thanet Sand and Chalk.

Contour maps from the more recent BGS 1:50,000 series geological maps presented in Figure 4 of Appendix C indicate that the base of London Clay is expected to be between 0mOD and -5mOD and the top of the Upper Chalk is at around -30mOD.

#### 3.2 Site investigations

Previous project site investigations researched and available in the vicinity of Euston Tower include:

- 12 no. boreholes (BH1 to BH12) and 9 no. trial pits (TP1 to TP9) Regents Place and Triton Square Geotechnical Investigation Report, Laing Technology Group Limited (LTG), dated April 1995. The site location plan and two closest logs (BH12 and TP8) are included in Appendix D.
- 1 no. borehole (BH1) at 1 Triton Square- Related to the recent refurbishment and foundation strengthening project undertaken by British Land, dated 2017; and,
- 6 no. boreholes (BH1 to BH 6) Tolmers Square Geotechnical Investigation Report, dated 1977. The site location plan and borehole logs have been included in Appendix D.

In relation to the proposed development at Euston Tower, an initial intrusive foundation and geotechnical investigation has been undertaken between February and July 2022.

- The aim of the investigation was to determine the suitability of a foundation re-use scheme and to investigate the existing piled foundations, ground, and groundwater conditions local to the Euston Tower.
- Excavations were carried out to the toe level of several existing piles to confirm the length and soil stratigraphy and properties, and to obtain samples for laboratory testing.
- Samples of the substructure steel and concrete were taken for examination and testing.

#### 3.3 Stratigraphy

Figure 14 presents a west to east geological cross-section, summarising existing previous local borehole information from Regents Place, Tolmers Square together with stratigraphy encountered from the 2022 foundation investigation.

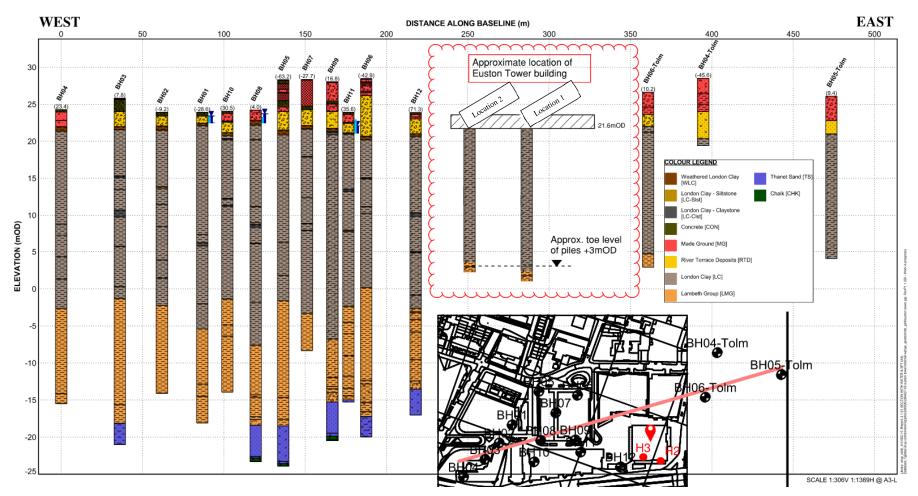

Figure 14 - West-east geological cross-section

Table 3 shows the stratigraphy encountered at the nearest investigation locations. The anticipated stratigraphy adopted for design and assessment is presented in Table 4.

Stratum	Euston investig		foundation tions 1 & 2 <sup>1</sup>	BH12 <sup>2</sup>			BH6 <sup>3</sup>		
	Depth (mbgl)	Top of stratum level (mOD)	Thickness (m)	Depth (mbgl)	Top of stratum level (mOD)	Thickness (m)	Depth(mbgl)	Top of stratum level (mOD)	Thickness (m)
Fill / Made Ground	0	+28.0	4.4	0.25	+23.62	0.6	0	+26.62	3
River Terrace Gravel	4.4	+23.6	1.6	0.85	+23.02	2	3	+23.62	1.6
London Clay (weathered)	6	+22.0	0.5	2.85	+21.02	0.35	4.6	+22.02	0.8
London Clay	6.5	+21.5	16.9	3.2	+20.67	23.3	5.4	+21.22	16.5
Lambeth Group Formation	23.4	+4.6	*	26.5	-2.63	10.9	21.9	+4.72	>1.8*
Thanet Sand	-	-	-	37.4	-13.53	>3.5*		1	<u>.</u>
End of hole	-	-	-	40.9	-17.03	n/a	23.7	+2.92	n/a

Table 3: Summary of encountered stratigraphy from nearby site investigations.

Notes:

\* Borehole/Trial pit terminated within stratum. Thickness not determined.

1. Euston Tower Foundation Investigation Locations 1 & 2 undertaken between February and July 2022 in relation to the proposed development.

2. Regents Place and Triton Square Geotechnical Investigation Report, Laing Technology Group Limited (LTG), dated April 1995.

3. Tolmers Square Geotechnical Investigation Report, dated 1977.

#### Table 4: Anticipated site stratigraphy

Stratum	Description	Thickness (m)	Top of stratum level (mOD)
Ground level	-	-	+28.0
Fill / Made Ground	SAND and GRAVEL with demolition and building waste (brick and mortar cobbles)	0.3	+28.0
River Terrace Gravel	Medium dense, yellow-brown, fine to coarse SAND and sub- angular to rounded, fine to coarse flint GRAVEL. Medium to coarse orange-brown sand and fine to medium gravel	1.6	+23.6
London Clay (weathered)	Firm, brown and yellow-brown mottled Silty CLAY	0.5	+22.0
London Clay	Stiff to very stiff dark grey, brown Silty CLAY. Occasional grey green silt veins/pockets and shell debris. Clay is very to extremely closely fissured. Interbedded claystone's. Becoming very stiff from 10.8m below top of London clay. Becoming very sandy from 22.3m below top of London Clay.	17.5	+21.6
Lambeth Group Formation (formerly known as Woolwich and Reading Beds)	Very stiff, grey mottled red and brown Silty CLAY with occasional bands of fine to medium grained sand. Becoming very stiff to hard. Becoming hard Sandy CLAY 6.9m below top of layer.	17.5	+4.0
Thanet Sand	Very dense, grey, fine to medium grained sand. Occasional interbedded pockets of silt/clay	3.5*	-13.5
Thanet Sand Note:	3.5*	-13.5	

\* Borehole terminated at 40.9mbgl within Thanet Sand. Layer thickness and underlying strata not proven within available investigations.

#### 3.4 **Ground model**

For the purposes of the Basement Impact Assessment presented in this report, a preliminary ground model has been adopted for ground movement assessment, as shown in Table 5. The formation level of existing basement was taken at +21.6mOD, based on the 2022 foundation investigation findings is taken as the upper ground surface.

Stratum	Top of stratum level	Undrained shear strength	Vertical undrained Young's modulus	Vertical drained Young's modulus	
	(mOD)	(kPa)	(MPa)	(MPa)	
London Clay Formation	+21.6 (Underside level of existing basement)	80 + 5 <i>z</i> <sup>1</sup>	$E_{u,v} = 40 + 2.5z^{1}$ ( $E_{u,v} = 500 c_{u}$ )	$E'_{v} = 25.6 + 1.6z^{1}$ $(E'_{v} = 320 c_{u})$	
Lambeth Group	+4.0	$168 + 5z^2$	$E_{u,v} = 84 + 2.5z^2$ ( $E_{u,v} = 500 c_u$ )	$E'_{v} = 53.8 + 1.6z^{2}$ $(E'_{v} = 320 c_{u})$	
Thanet Sand	-13.5	-	-	$E'_{v} = 200$	
Chalk	-20.0 Assumed to be rigid boundary				
Notes:	1	1			

#### Table 5: Preliminary ground model adopted for ground movement assessment.

 $z^1$  denotes depth in metres below London Clay Formation surface. 1.

 $z^2$  denotes depth in metres below Lambeth Group surface. 2.

The undrained shear strength and stiffness profiles for Lambeth Group (Clay) are assumed to be a continuation from the 3. respective overlying London Clay Formation profiles.

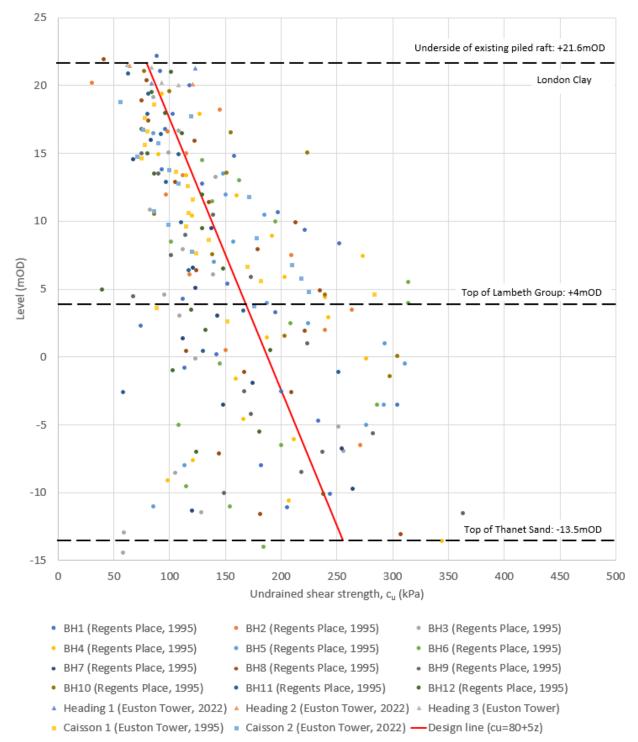

Figure 15 shows the supporting undrained shear strength results from UT100 unconsolidated undrained (UU) triaxial tests.

Figure 15: Undrained shear strength from Undrained Unconsolidated triaxial results on 100mm diameter samples.

#### 3.5 Groundwater

A map of the Lost Rivers of London is shown in Figure 16. There are no lost rivers recorded within the site extent.

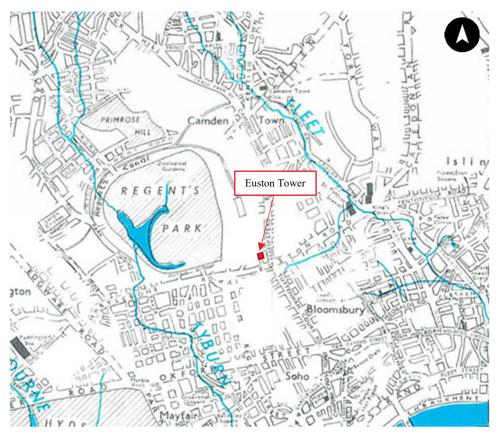

Figure 16 - Lost rivers of London (https://www.hiddenhydrology.org/, accessed 17/01/2023)

As relevant to the basement impact assessment, groundwater is anticipated in the shallow aquifer within the superficial deposits (principally the River Terrace Deposits). Groundwater is expected to be either in continuity within the aquifer or encountered as perched, due to variation in the surface of impermeable strata (clays and/or by the presence of buried man-made structures).

A summary of groundwater readings from nearby investigation locations are included below in Table 6. The groundwater readings are typically between 1m (+22.87mOD) and 1.8m (+22.07mOD) below top of the basement slab (+23.87mOD) at the location of BH12. These readings relate to the development of 1 Triton Square within the Regents Place estate.

ВН	Monitored Groundwater Level (mOD)	Source (refer notes)
BH12 (water strike)	+22.87	(1) – year 1995
TP08 (water strike & recharge)	+22.62	(1) – year 1995
CH03 (standpipe)	+22.5	(2) – year 2017
CH02 (standpipe)	+22.4	(2) – year 2017
BH101 (standpipe)	+22.25	(2) – year 2017
CH01 (standpipe)	+22.10	(2) – year 2017
BH11 (standpipe)	+22.07	(1) – year 1995
Notes:		

Table 6: Monitored groundwater levels from nearby site investigations.

Groundwater was also encountered in the River Terrace Deposits during recent foundation strengthening works carried out at 1 Triton Square (2018-2019). Water levels were generally controlled for raft and pile cap construction works by localised temporary works and pumping.

During the 2022 foundation investigation at Euston Tower, water was encountered within the superficial deposits and was controlled by localised temporary works and pumping.

## 4. Screening assessment

#### 4.1 Screening assessment methodology

The screening assessment criteria used to guide this Basement Impact Assessment is taken from London Borough of Camden guidance for subterranean development 'the Arup Report' (Camden, 2010). The screening assessment including potential impact and mitigation is set out in the tables under the following Sections 4.2 to 4.4. A summary of the key impacts and proposed mitigation is presented in Section 4.5.

#### 4.2 Subterranean Screening Assessment

Question	Response	Proposal/ Mitigation
1a. Is the site located directly above an aquifer?	Yes. Made Ground and River Terrace Deposits are present outside and beneath the existing basement footprint.	The proposals do not include widening the plan extent of existing basement. Localised deepening within the River Terrace Deposits and London Clay underneath the existing basement is proposed to construct Basement 02 level plant/tank space and deepen areas of the existing B1.
1b. Will the proposed basement extend beneath the water table surface?	Yes. Groundwater is present within Made Ground and River Terrace Deposits.	Proposed local Basement 02 plant/tank level beneath the existing single level basement involve localised excavation within River Terrace Deposits and London Clay. Provision for temporary water control and retaining wall should be made.
2. Is the site within 100m of a watercourse, well (used/ disused) or potential spring line?	No.	N/A
3. Is the site within the catchment of the pond chains on Hampstead Heath?	No.	N/A
4. Will the proposed basement development result in a change in the proportion of hard surfaced/ paved areas?	No.	N/A
5. As part of the site drainage, will more surface water (e.g., rainfall and run-off) than at present be discharged to the ground (e.g., via soakaways and/ or SUDS)?	No.	N/A Refer to Flood Risk Assessment report (Arup, 2024, Report ref.: 281835-ARP- XX-XX-RP-CD-0001), Flood Risk Assessment Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN- CD-0001), Drainage & SuDS Strategy (Arup, 2024, Report ref.: 181835-ARP- XX-XX-RP-CD-0002) and Drainage and SuDS Strategy Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN- CD-0002).
6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to, or lower than, the mean water level in any local point (not just the pond chains on Hampstead Heath) or spring line?	Yes	A portion of the local B02 basement proposed as part of the application will be below the water table. This will be waterproofed by design to resist water ingress to the space, tied in to the existing basement.

#### 4.3 Stability Screening Assessment

Question	Response	Proposal/ Mitigation
1. Does the existing site include slopes, natural or manmade, greater than 7°?	No.	N/A
2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?	No.	N/A
3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?	No.	N/A
4. Is the site within a wider hillside setting in which the general slope is greater than 7°?	No.	N/A
5. Is the London Clay the shallowest stratum at the site?	No. However, existing pile cap for tower building founded directly on London Clay.	N/A
6. Will any trees be felled as part of the proposed development and/ or are any works proposed within any tree protection zones where trees are to be retained?	Yes, the tree planting is to be adjusted as part of the development, however trees are located within engineered tree pits.	The existing and proposed trees are within engineered tree planting troughs and/or otherwise not expected to cause ground movement at the basement formation level due to depth.
7. Is there a history of seasonal shrink-swell subsidence in the local area and/ or evidence of such effects at the site?	London Clay stratum present is susceptible to shallow shrink swell effects generally, following established guidance.	The foundations/basements for the development are at greater than 5m depth below ground, and trees are located within engineered tree pits.
8. Is the site within 100m of a watercourse or potential spring line?	No.	N/A
9. Is the site within an area of previously worked ground?	Yes. Made Ground is present on site and has been modified over site's development history.	Existing basement has removed majority of Made Ground so extent remaining is limited. Further investigations are recommended if fill is to be considered as a bearing stratum in design.
10a. Is the site within an aquifer?	Yes. Made Ground and River Terrace Deposits are present outside existing basement footprint.	The existing basement within the site is directly underlain by London Clay. The proposals do not include widening the plan extent of existing basement.
10b. Will the proposed basement extend beneath the water table such that dewatering may be required during construction?	Yes.	Temporary water control provisions are recommended for proposed Basement 02 excavation within the River Terrace Deposits and London Clay.
11. Is the site within 50m of Hampstead Heath ponds?	No.	N/A
12. Is the site within 5m of a highway or pedestrian right of way?	Yes. The edge of existing basement is located within 3m of existing pedestrian walkways.	Contractor to agree proposed hoarding line to minimise impact on public right of way and agree with Camden planning authority.
13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?	Yes. The proposed Basement 02 level will be deeper than the existing single level basement. However, 2-level basements are present at neighbouring 10-30 Brook Street, so this will be	Ground movement assessment has been carried out in Section 6.

Question	Response	Proposal/ Mitigation
	less deep than adjoining basements.	
14. Is the site over (or within the exclusion zone of) any tunnels, e.g., railway lines?	Yes. The site falls within the 2015 Crossrail 2 Safeguarding Directions (see Appendix E for correspondence from Crossrail 2). The site is located to the west of Northern and Victoria line tunnels, to the north of St Johns Wood to Back Hill deep cable tunnel and Hammersmith & City, Circle and Metropolitan line tunnel)	Third party consultation and engagement with Crossrail 2 will be carried out. A preliminary ground movement assessment will be carried out separately to assess the impact of proposed redevelopment on existing and future tunnels.

#### 4.4 Surface Flow and Flooding Screening Assessment

Question	Response	Proposal/ Mitigation
1. Is the site within the catchment of the pond chains on Hampstead Heath?	No.	N/A
2. As part of the proposed site drainage, will surface water flows (e.g., volume of rainfall and peak run-off) be materially changed from the existing route?	No.	N/A
3. Will the proposed basement development result in a change in the proportion of hard surfaced/ paved areas?	No.	N/A
4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent properties or downstream watercourses?	No.	N/A
5. Will the proposed basement result in changes to the quality of surface water being received by adjacent properties or downstream watercourses?	No.	N/A
6. Is the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk from flooding, for example because the proposed basement is below the static water level of nearby surface water feature.	No. The site is located in flood zone 1 – an area of low probability of flooding.	N/A

#### 4.5 Summary of potential impacts and mitigations

The following key potential impacts have been identified from the screening assessment. Recommendations for further assessment are made:

#### Subterranean screening assessment:

An aquifer is present at the site location. The proposed local B02 basement would introduce local cut-off of the shallow aquifer to the London Clay aquiclude through the River Terrace Deposits (upper aquifer). However, the size of the local B02 basement is not significant in relation to the site footprint. Refer to the Flood Risk Assessment report (Arup, 2024, Report ref.: 281835-ARP-XX-XX-RP-CD-0001), Flood Risk Assessment Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN-CD-0001), Drainage & SuDS Strategy (Arup, 2024, Report ref.: 181835-ARP-XX-XX-RP-CD-0002) and Drainage and SuDS Strategy Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN-CD-0002) for assessment of surface water and SUDS.

#### Stability Screening Assessment:

Ground movement assessments for assets falling within the zone of influence associated with the proposed redevelopment are recommended. The zone of influence for ground movements refers to area with calculated vertical ground movements greater than +/-1mm.

The relative depth of the proposed Basement 02 is deeper than the existing single level basement for the Euston Tower building. Ground movements that will impact neighbouring buildings are to be assessed (presented in Section 6.)

The site falls within the 2015 Crossrail 2 Safeguarding Directions and therefore consultation is expected to be required. The site is located to the west of Northern and Victoria line tunnels, to the north of St Johns Wood to Back Hill deep cable tunnel and Hammersmith & City, Circle and Metropolitan line tunnel.

In relation to TfL and utility assets, third party consultation and engagement with the respective asset owners will be carried out. A preliminary ground movement assessment will be carried out separately to assess the impact of proposed redevelopment on existing and future assets.

#### Surface flow and flooding

Refer to the Flood Risk Assessment report (Arup, 2024, Report ref.: 281835-ARP-XX-XX-RP-CD-0001), Flood Risk Assessment Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN-CD-0001), Drainage & SuDS Strategy (Arup, 2024, Report ref.: 181835-ARP-XX-XX-RP-CD-0002) and Drainage and SuDS Strategy Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN-CD-0002)

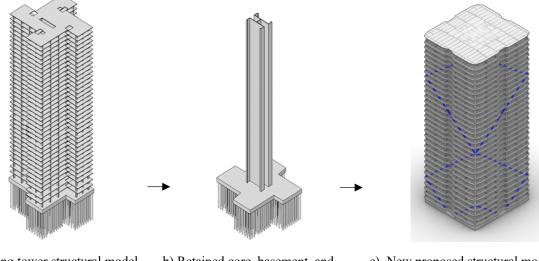

The cumulative effects of basement development are not considered to be significant or require assessment.

## 5. Basement design

#### 5.1 Proposed development

The proposed development of Euston Tower involves the deconstruction of the existing floorplates from roof to ground floor level, with the central core, foundations and basement retained. A new structural frame and new floorplates will be constructed, with the foundations and central core being reused. New supplementary foundations will be constructed to support the new superstructure where it extends beyond the extent of the existing pile cap.

Figure 17 illustrates the general proposed redevelopment stages for Euston Tower in outline.

a) Existing tower structural model

b) Retained core, basement, and foundation after partial deconstruction c) New proposed structural model

#### 5.2 Proposed basement geometry

The existing single level basement between the Euston Tower building and surrounding the building is to be retained and locally deepened. A local Basement 02 level is proposed underneath the existing single level basement to accommodate a water tank and plant room. The proposed Basement 02 level has a plan dimension of approximately 5.5m x 34m (187 sqm), located to the west of existing pinwheel piled raft as illustrated in Figure 18. The proposed B2 FFL is approximately +19.77mOD in relation to the general 1 level basement level of +23.9mOD.

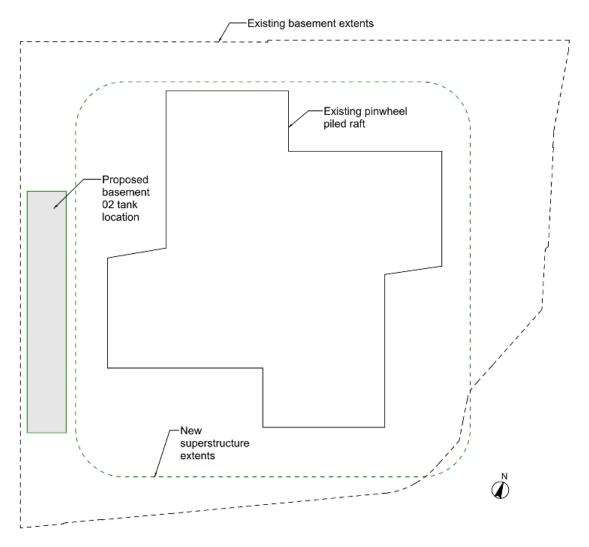

Figure 18: Proposed Basement 02 plan (extract from 3XN drawing no.: ET\_DR-A\_20098)

#### 5.2.1 Proposed B2 retaining wall

The Basement 02 temporary embedded wall is assumed to be 600mm diameter contiguous pile wall with c/c pile spacing of 1.2m. The contiguous pile toe level is assumed to be at +14mOD. The B02 formation level has been taken at +19.3mOD. An unplanned excavation of 0.5m has been considered in the ultimate limit state analysis.

Oasys FREW software have been used to carry out the proposed Basement 02 embedded retaining wall analysis. FREW is a pseudo-FE analysis which models the soil structure interaction for excavation in front of retaining walls. FREW analyses the behaviour for each stage of the construction sequence. FREW calculates wall displacement, shear forces, bending moments, and earth and water pressures on both sides of wall at each construction stage.

The pile wall bending stiffness short and long term EI are calculated as  $0.7E_0I$  and  $0.5E_0I$  respectively, where  $E_0=34$ GPa. A temporary prop stiffness of 40,000kN/m/m has been assumed.

A variable surcharge of 10kPa has been adopted during construction on the active side of the wall. The future B1 slab permanent and variable surcharges behind the contiguous wall are taken to be 45 kPa and 10 kPa respectively.

The envisaged Basement 02 construction stages modelled in FREW are summarised as below:

Stage 0: Initial condition Stage 1: Install wall Stage 2: Cast B1 slab Stage 3: Partial excavation to +20.5mOD
Stage 4: Install temporary prop at +22.4mOD
Stage 5: Excavation to formation level at +19.3mOD
Stage 6: Cast B02 slab wet concrete (weight as surcharge)

Stage 7: Cast B02 slab (apply stiffness)

Stage 8: Cast B1 roof slab (apply stiffness)

Stage 9: Remove temporary prop

Stage 10: Long term drained soil conditions

*Stage 11: Apply concrete relaxation to*  $0.5E_0I$ .

Further details on the calculations for proposed B2 retaining wall are provided in Appendix G.

## 5.3 Foundations

#### 5.3.1 Existing foundations

The 2022 foundation investigation demonstrated that piles are arranged in groups beneath the columns and structural cores. Figure 19 illustrates the understanding of pile arrangements under the tower. The reinforced concrete piles were discovered to be straight shafted with diameter of 2ft (610mm) and were approximately 19m long. Intrusive investigations have found the piles to be reinforced to full pile depth.

The pinwheel raft/ pile cap was found to be 2.8m thick, with a structural thickness of 2.4m. The raft extends over the entire footprint of the existing tower and is used to spread the load from individual columns into the pile groups. The piled raft was found to be in good condition given its age, despite being sparsely reinforced compared to current modern standards. No corrosion of reinforcing steel has been observed.

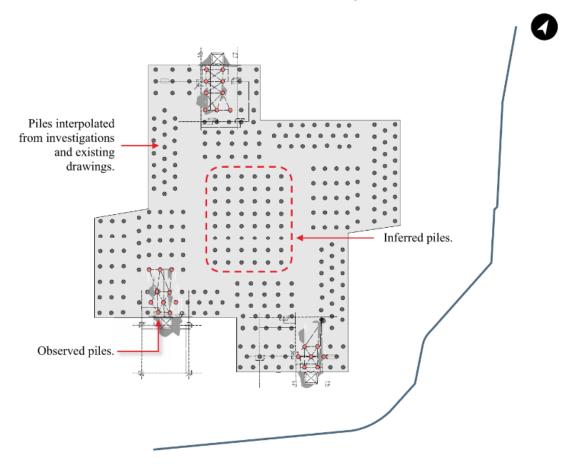

Figure 19: Plan showing anticipated existing foundations of Euston Tower

#### 5.3.2 New foundations

Due to the limited knowledge of the existing foundations, a load balance approach is to be adopted where the new applied loading on the existing foundation is kept less than or equal to the existing loading regime. Basement load spreading structures are proposed to transfer loading from new column locations to the previous column locations in the basement.

New 1500mm thick pile caps with 900mm diameter piles are proposed to support new columns landing outside of the existing pinwheel piled raft, as shown in Figure 20. Options for foundations in the southeast corner to support new column load are currently under development. Pile groups or a single hand dug caisson are being considered due to the close proximity to the existing retaining wall. The new B1 slab will be lowered by approximately 0.5m, over the zone set inwards from the B1 perimeter to retain the toe of the existing retaining wall, as illustrated in Figure 20. The new B1 slab will cover the new pile caps and where removed and replaced to install new foundations, reinstate the diaphragm provided by the existing B1 slab.

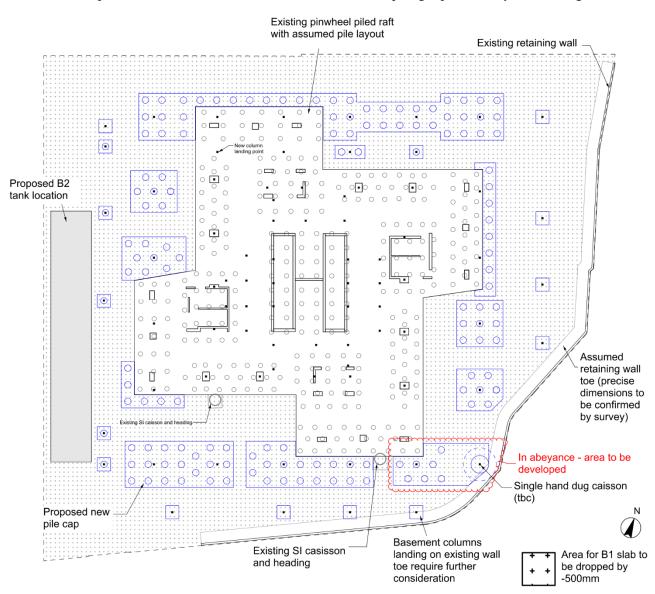

Figure 20: New foundations showing existing piled raft, and new pile caps.

## 5.4 Construction sequence

For the purposes of the basement impact assessment presented in this report, the currently anticipated construction sequence for the proposed redevelopment is illustrated in Figure 21 and outlined below in summary:

- Site enabling works.
- Deconstruction of Euston Tower floorplates starting from roof level downwards.
- Deconstruction of ground floor slab and installation of temporary props to support the existing retaining wall.
- Earthworks to provide piling platform level within basement for new foundations.
- Installation of foundation piles for new building superstructure and temporary retaining wall (contiguous piled wall or sheet pile wall) around proposed local Basement 02.
- Localised excavation to Basement 02 formation level with temporary propping as necessary.
- Construction of new B1 slab & substructure (including new pile caps).
- Construction of ground floor slab and new building floorplates above.

A 'bottom-up' traditional construction of the proposed local Basement 02 and temporary retention of the existing basement to enable local deepening using high support temporary propping is proposed. The temporary works and construction sequence will be further developed at later design stage and following engagement with specialist contractors and temporary works designers.

For further details refer to the Construction Management Plan included with the application.

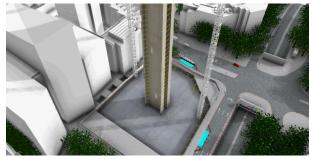

a) Deconstruction of floorplates starting from roof level downwards. Removal of ground floor slab and installation of temporary props to support the basement wall.

c) Casting of new B1 basement slab (localised deepening for local proposed Basement 02 beneath not shown), concurrent to demolition.

b) Installation of additional foundation piles within the basement (concurrent to demolition)

d) completion of floorplate deconstruction to ground level

e) Construction of ground floor slab and new floorplates above to building completion

Figure 21: Current anticipated indicative construction sequence (extract from indicative proposal)

# 6. Preliminary ground movement assessment

#### 6.1 Scope of the assessment

A preliminary ground movement assessment for the proposed development has been carried out within this Basement Impact Assessment. The zone of influence for ground movements associated with the proposed development has been determined, followed by assessment of potential impact on neighbouring buildings. Camden Planning Guidance (CPG) on Basements (Camden, 2021) and Policy A5 on basement states that the anticipated damage category for neighbouring structures should not exceed category 1 'very slight' on the Burland scale. The ground movement assessment is described further in the following sections.

The impact of ground movements on third party utility assets (Thames Water, Gas, London Underground and Future Crossrail 2 etc) will be assessed in separate technical assessments for review by the respective third parties ahead of the proposed development.

#### 6.2 Ground movements

#### 6.2.1 Introduction

Ground movements arising from change in loading to the ground have been quantified and considered cumulatively to assess the impact on neighbouring buildings. It is noted that the principal cause of ground movement is the unloading and reloading of the ground from partial deconstruction and construction of new development. The new local B02 basement construction is a small proportion of the calculated ground movement and the zone of influence does not extend outside the site boundary. The unloading due to lowering of the B1 slab is small relative to unloading due to partial deconstruction. The following sections describe the methodology and results of the ground movement assessment undertaken.

The horizontal movement of the retaining walls to form the B02 local basement area are not considered in the assessment as the surrounding basement of the building encompasses a 45-degree influence zone, expressed from the base of the excavation. Therefore, the effect of the basement construction considered is limited to the unloading/reloading of the ground.

#### 6.2.2 Ground movement assessment

Sources of ground movements arising from the development due to change in loading are outlined as follows:

- 1. Unloading due to partial deconstruction of existing superstructure
- 2. Unloading due to localised excavation of proposed local Basement 02.
- 3. Unloading due to lowering of B1 slab.
- 4. Loading due to addition of new superstructure

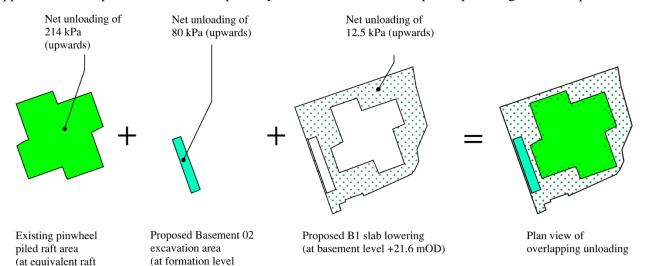

Oasys PDISP, analysis software, has been used to calculate ground movements in the short and long-term using undrained and drained conditions respectively. Settlements and/or heave are calculated in PDISP by using a linear elastic soil model and the Boussinesq method for stress distribution. The Boussinesq method calculates the stresses in the soil due to applied loads using equations derived by Boussinesq (1885). In the analysis, settlements/ heave above the applied load is conservatively assumed to be the same as that at the level of applied load. Soil structure interaction effects are not considered in the analysis.

Three key stages have been considered for ground movement assessment and are presented in Table 7.

#### Table 7: Key stages considered for ground movement assessment.

Considered key stages	Changes in loading	Soil conditions
During construction	Partial deconstruction unloading + B2 basement excavation unloading +B1 slab lowering (unloading)	Undrained
End of construction (short term)	Partial deconstruction unloading + B2 basement excavation unloading + B1 slab lowering (unloading) + new superstructure loading	Undrained
End of construction (long term)	Partial deconstruction unloading + B2 basement excavation unloading + B1 slab lowering (unloading) + new superstructure loading	Drained

An assessment has been carried out to estimate changes in loading as mentioned above, to determine the net unloading/ loading applied to the ground. Figure 22 and Figure 23 illustrate the net unloading/ loading applied at different areas and levels. Unloading due to partial deconstruction of existing superstructure and loading due to new superstructure are assumed to be transferred down the piles within London Clay and applied onto an equivalent raft area empirically determined at 2/3 of the pile depth using a 1H:4V spread.

 level +8.9 mOD)
 +19.3 mOD)

 Figure 22: Net unloading applied in Oasys PDISP model, resulting from partial superstructure deconstruction, proposed B2 excavation and B1 slab lowering.

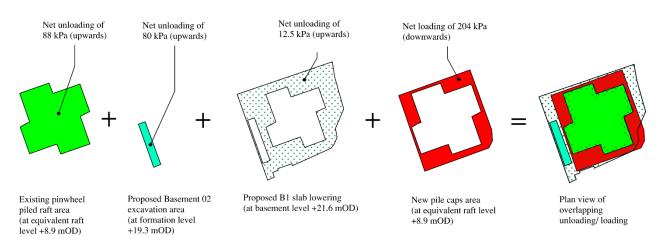

Figure 23: Net unloading/ loading applied in Oasys PDISP model, resulting from partial superstructure deconstruction, proposed B2 excavation, B1 slab lowering and new superstructure loading.

#### 6.2.3 Ground movement results

Short and long term vertical ground movements associated with the considered key stages (see Table 7) are presented in Figure 24 to Figure 26. Zone of influence for ground movements refers to area with calculated vertical ground movements greater than +/-1mm. Downward movements are presented as +ve. Further details on ground movement calculations are provided in Appendix H.

1 Triton Square and 2 Triton Square do not fall within the zone of influence for ground movements associated with the proposed redevelopment.

The calculated ground movements indicate that in the long term, the southern façade of Northeast Quadrant (10-30 Brock Street) would experience settlements between 1mm and 8mm.

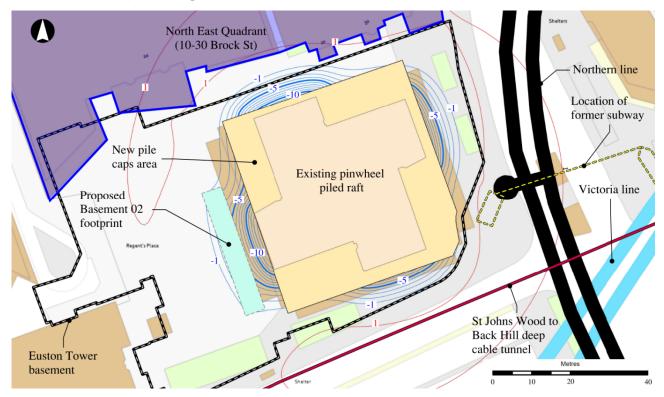

Figure 24: Calculated short term ground movement (mm) at basement level +21.6mOD resulting from partial superstructure deconstruction, proposed Basement 02 excavation and B1 slab lowering (downward movements are presented as +ve).

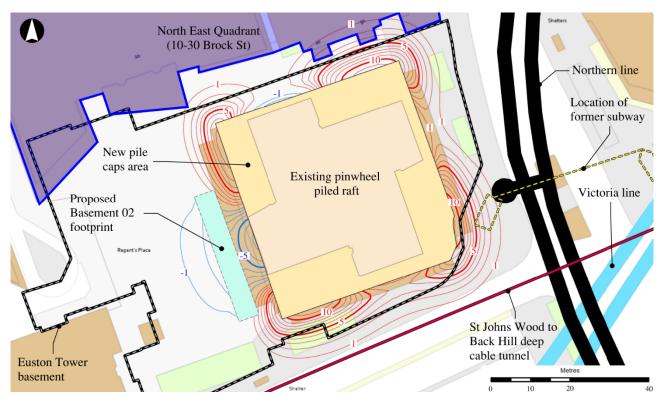

Figure 25: Calculated short term ground movement (mm) at basement level +21.6mOD resulting from partial superstructure deconstruction, proposed Basement 02 excavation, B1 slab lowering and new superstructure loading (downward movements are presented as +ve).

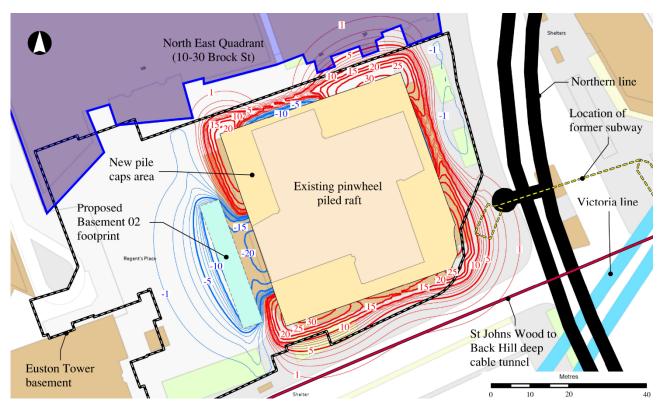

Figure 26: Calculated long term ground movement (mm) at basement level +21.6mOD resulting from partial superstructure deconstruction, proposed Basement 02 excavation, B1 slab lowering and new superstructure loading (downward movements are presented as +ve).

### 6.3 Impact on Northeast Quadrant (10-30 Brock Street)

The calculated ground movements described in Section 6.2 have been used to carry out Burland building damage assessment of the neighbouring buildings due to calculated ground movements. Building section lines (10-30 Brock Street) shown in Figure 27 have been taken for assessment.

For each structure, the effect of ground movement has been considered using the Burland (1995) method. This uses vertical deflections and horizontal strains, assuming that the building follows greenfield ground movements (without benefit from the stiffness of the structure itself), in order to derive a building damage category that is related to observed crack width and ease of repair. The damage categories are summarised in Figure 29. Burland damage category 0,1, and 2 refer to aesthetic damage, category 3 and 4 relate to serviceability and function and category 5 refers to stability related damage. The assessment does not account for soil-structure interaction.

For the preliminary building damage assessment, the potential damage criteria are taken to not exceed Category 1 (Very slight) as defined by Burland (1995). Category 1 (Very slight) can be defined as:

- 'Slight' damage consisting of 'fine cracks that can easily be treated during normal decoration.;
- Perhaps isolated slight fractures in building;
- Crack in external brickwork visible upon inspection; and
- The approximate crack width is less than 1mm.

Damage is a function of strain within a building due to flexure and elongation/ compression. The ground movement impact has been assessed based on the buildings being in good condition with no significant existing defects. Figure 28 illustrates the relationship between impact category, deflection ratio and horizontal tensile strain.

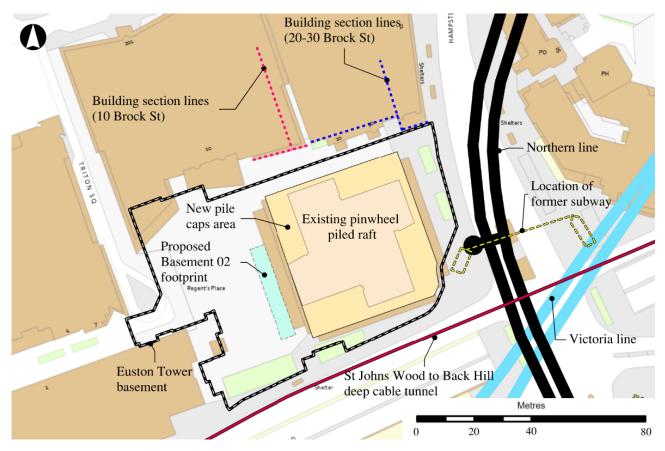

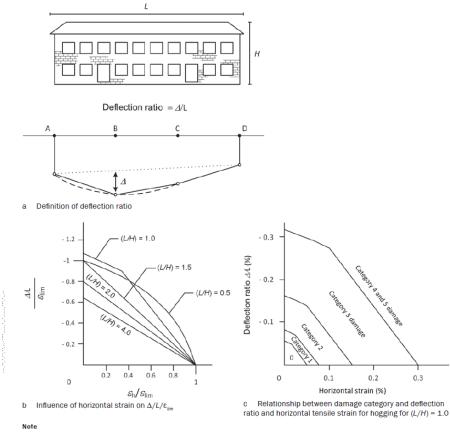

Figure 27: Neighbouring 10-30 Brock Street building section lines analysed for potential impact.

By adopting values of  $\epsilon_{an}$  associated with various damage categories given in Table 6.4, figure (b) can be developed into an interaction diagram showing the relationship between  $\Delta/L$  and  $\epsilon_n$  for a particular value of L/H figure (c) shows such a diagram for (L/H) = 1.0.

Category of damage	Description of typical damage (ease of repair is underlined)	Approximate crack width (mm)	Limiting tensile strain, ε <sub>lim</sub> (%)
0 Negligible	Hairline cracks of less than about 0.1 mm are classed as negligible	<0.1	0.0 to 0.05
1 Very slight	Fine cracks that can easily be treated during normal decoration. Perhaps isolated slight fracture in building. Cracks in external brickwork visible on inspection	<1	0.05 to 0.075
2 Slight	Cracks easily filled. Redecoration probably required. Several slight fractures showing inside of building. Cracks are visible externally and some repointing may be required externally to ensure weathertightness. Doors and windows may stick slightly.	<5	0.075 to 0.15
3 Moderate	The cracks require some opening up and can be patched by a mason. Recurrent cracks can be masked by suitable lining. Repointing of external brickwork and possibly a small amount of brickwork to be replaced. Doors and windows sticking. Service pipes may fracture. Weathertightness often impaired.	5 to 15 or a number of cracks >3	0.15 to 0.3
4 Severe	Extensive repair work involving breaking-out and replacing sections of walls, especially over doors and windows. Windows and frames distorted, floor sloping noticeably. Walls leaning or bulging noticeably, some loss of bearing in beams. Services pipes disrupted.	15 to 25, but also depends on number of cracks	>0.3
5 Very severe	This requires a major repair, involving partial or complete rebuilding. Beams lose bearings, walls lean badly and require shoring. Windows broken with distortion. Danger of instability.	Usually >25, but depends on numbers of cracks	

Figure 29: Classification of visible damage to walls (after Burland et al, 1977, Boscardin and Cording, 1989, and Burland, 2001) and target damage category in red (extract from CIRIA 760)

#### 6.3.1 10 Brock Street

Key assumptions made for potential impact assessment on 10 Brock Street are outlined below:

- The structure is expected to be a 9-storey framed building with a two level basement, with calculated movements assessed at the foundation level.
- Burland assessment assumes a structural height of 40m above basement level +21.6mOD, with the neutral axis taken at the mid height and full height for sagging and hogging respectively.
- E/G ratio of 12.5 is assumed for concrete framed structure (Burland, 1995)

The most critical section for 10 Brock Street has been identified as illustrated in Figure 30. The Burland damage assessment results (see Figure 31 and Figure 32) indicated that the structure has potential damage category 0 (negligible).

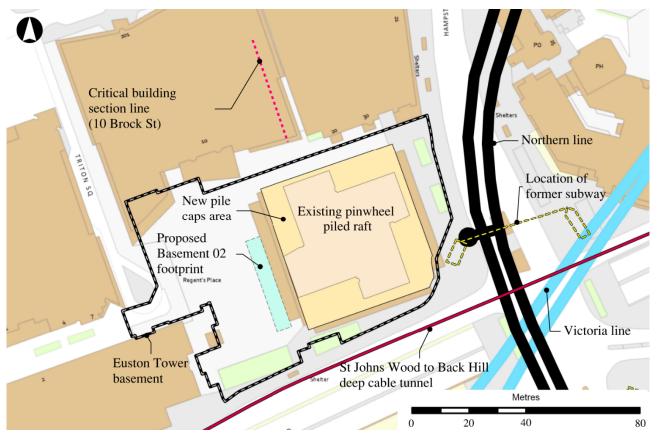

Figure 30: Plan showing critical section (in pink dashed line) for ground movements at 10 Brock St.

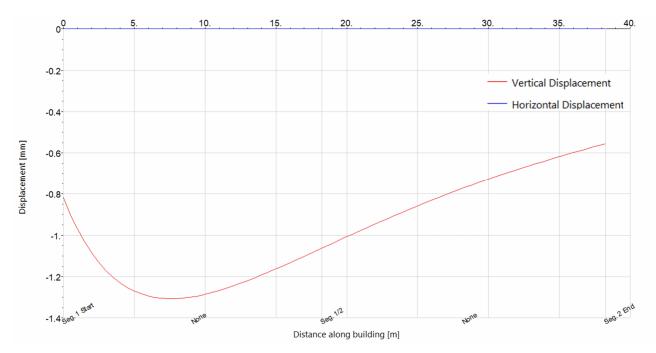

Figure 31: Short term (during construction) displacements along 10 Brock Street critical section line

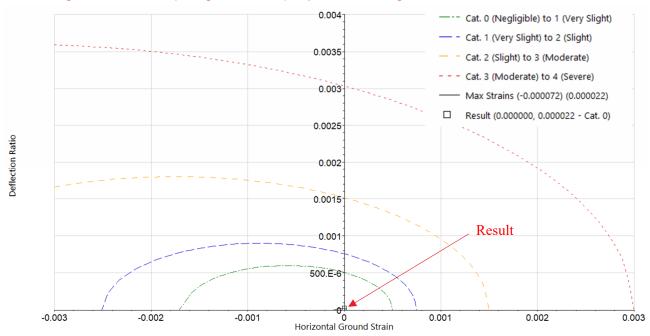

Figure 32: Short term (during construction) building damage interaction for 10 Brock Street critical section line

#### 6.3.2 20-30 Brock Street

Key assumptions made for potential impact assessment on 20-30 Brock Street are outlined below:

- The structure expected to be an 8-storey framed building with a two-level basement, with calculated movements assessed at the foundation level.
- Burland assessment assumes a structural height of 36m above basement level +21.6mOD with the neutral axis taken at the mid height and full height for sagging and hogging respectively.
- E/G ratio of 12.5 assumed for concrete framed structure (Burland, 1995)

The most critical section for 20-30 Brock Street has been identified as illustrated in Figure 33. The Burland damage assessment results (see Figure 34 and Figure 35) indicated that the structure has potential damage category 0 (negligible).

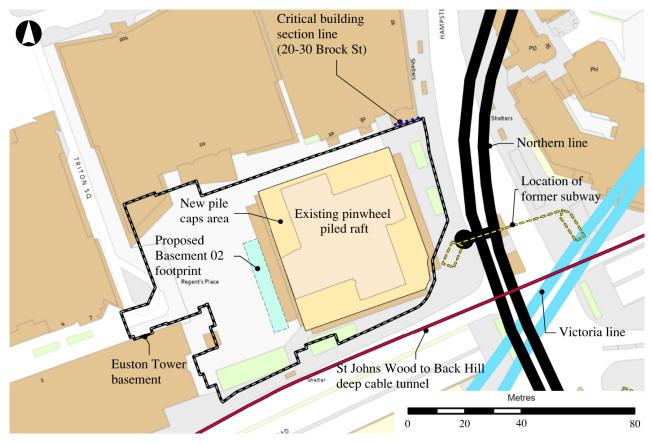

Figure 33: Plan showing critical section (in blue dashed line) for ground movements at 20-30 Brock St.

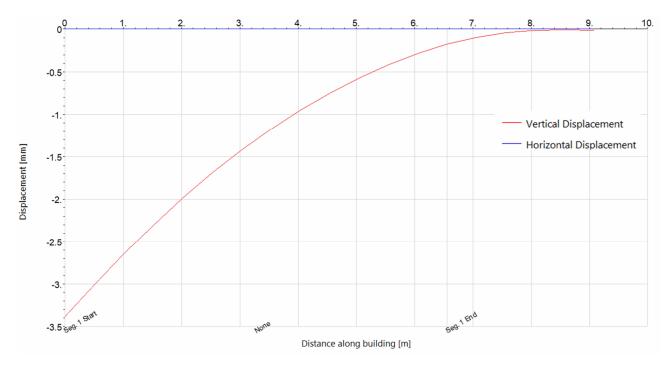

Figure 34: Long term displacements along 20-30 Brock Street critical section line

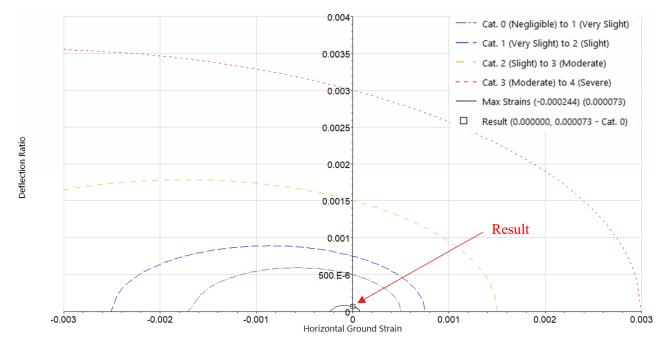

Figure 35: Long term building damage interaction for 20-30 Brock Street critical section line

#### 6.3.3 Burland damage assessment results summary

Assessment of the potential impact of the calculated ground movements on neighbouring 10-30 Brock Street buildings has been carried out using the Burland (1995) method. Table 8 shows a summary of the preliminary impact assessment results.

The critical building sections lines for 10 and 20-30 Brock Street are found to have damage category 0 'negligible' on the Burland scale.

Table 8: Summary of neighbouring buildings preliminary damage category

Neighbouring building	Critical section	Burland damage category
10 Brock Street	Refer to figures	0 (Negligible)
20-30 Brock Street	Refer to figures	0 (Negligible)

The potential impact on Northeast Quadrant (10-30 Brock Street) is not anticipated to exceed category 1 'very slight' on the Burland scale and is compliant with Camden Planning Guidance (CPG) on Basements (Camden, 2021).

# 7. Basement impact assessment conclusions

## 7.1 Summary

The assessment presented in this BIA report is based on guidance provided in the following documents (listed in top-down hierarchy order):

- Camden Local Plan Policy A5 'Basements' (Camden 2017).
- Camden Planning Guidance (CPG) on Basements (Camden, 2021); and
- Camden geological, hydrogeological and hydrological study. Guidance for subterranean development (Camden, 2010).

A screening assessment has been carried out on the proposed redevelopment at Euston Tower in accordance with Camden geological, hydrogeological and hydrological study. Guidance for subterranean development (Camden, 2010). The proposed local B02 basement is expected have an impact on groundwater flow and levels locally to the new basement area due to the introduction of a full local cut-off of the shallow aquifer to the London Clay aquiclude through the river terrace deposits (upper aquifer). However, due to the size and location of the local B02 basement proposal this is expected to be negligible and not present a heightened risk to adjacent structures. The proposed B02 waterproof basement also excludes the ground mass within its enclosed area from groundwater. This will tend to reduce field capacity for water retention/storage and may result in a higher local groundwater level during or following rainfall events, however due to the small size of the basement and location within the site the effect is expected to be negligible.

Based on the screening assessment presented in this report and findings from Flood Risk Assessment report (Arup, 2024, Report ref.: 281835-ARP-XX-XX-RP-CD-0001) and Flood Risk Assessment Addendum (Arup, 2024, Report ref.: 281835-ARP-XX-XX-TN-CD-0001), it is concluded that the proposed basement development is unlikely to result in groundwater or surface water issues and is therefore compliant with the Camden Planning Guidance (CPG) on Basements (Camden, 2021).

The relative depth of the proposed Basement 02 level is deeper than the existing single level basement. Preliminary ground movement assessment carried out in this report indicated that the neighbouring 1 Triton Square and 2 Triton Square do not fall within the zone of influence for ground movements associated with the proposed redevelopment, defined as greater than 1mm. The southern façade of neighbouring Northeast Quadrant (10-30 Brock Street) falls within the zone of influence and is calculated to experience long term settlements between 1mm and 8mm. However, the potential impact of the long-term settlements on 10-30 Brock Street is calculated to fall within damage category 0 'negligible' on the Burland scale. This does not exceed category 1 'very slight' on the Burland scale and is compliant with Camden Planning Guidance (CPG) on Basements (Camden, 2021).

The previous version of this BIA report has undergone audit process (see CampbellReith Basement Impact Assessment Audit, Report ref..: SSkb14006-59-230424-Euston Tower\_D1, 2024). In response to comments raised, a technical note was prepared (see Arup, 2024, Basement Impact Assessment Audit [2023/5240/P] File Note, Ref: 281835-07). Table 9 shows a comparison of the basement impact assessment results update. There is a small reduction in long term settlements calculated for neighbouring 10-30 Brock Street. The Burland damage category calculated is unchanged at damage category 0 'negligible' on the Burland scale.

Neighbouring building	Results	Previous version of BIA and audit response	Current BIA report
10-30 Brock Street	Long term settlements	2mm to 10mm	1mm to 8mm
Succi	Burland damage category	0 (Negligible)	0 (Negligible)

Table 9: Summary of Basement Impact Assessment results update

The site falls within the 2015 Crossrail 2 Safeguarding Directions and is located to the west of Northern and Victoria line tunnels, to the north of St Johns Wood to Back Hill deep cable tunnel and Hammersmith & City, Circle and Metropolitan line tunnel). Third party consultation and engagement with the respective asset owners is in progress. Ground movement assessments and construction method statements will be carried out in separate technical submissions for review by the respective third parties ahead of proposed redevelopment.

## 7.2 Monitoring strategy

A monitoring regime is recommended to be scoped and specified to measure the ground and asset movements during partial superstructure deconstruction, localised excavation, and construction of the new superstructure, in order to verify that they are within the assessed range. The required monitoring will be confirmed at later design stages following development of the construction methodology and agreement with third party building owners.

In addition to monitoring of buildings, monitoring of existing LUL underground assets, and other third-party assets would be scoped and specified based on ground movement assessments of these assets and development of the basement design and construction sequence.

Appendix E – Crossrail 2 safeguarding correspondence

From: Crossrail2 <<u>Crossrail2@tfl.gov.uk</u>>
Sent: Monday, October 9, 2023 3:07 PM
To: Henry Tayler <<u>Henry.Tayler@arup.com</u>>; Crossrail2 <<u>Crossrail2@tfl.gov.uk</u>>
Cc: G.Williams@Gardiner.com; j.pennell@gardiner.com; Marc Easton <<u>Marc.Easton@arup.com</u>>
Subject: RE: Euston Tower, 286 Euston Road, London. Crossrail 2 Safeguarding

You don't often get email from <a href="mailto:crossrail2@tfl.gov.uk">crossrail2@tfl.gov.uk</a>. Learn why this is important

Henry,

Euston Tower, 286 Euston Road, does fall within the 2015 Crossrail 2 Safeguarding Directions. This means that any consultation on planning applications submitted to the Local Planning Authority in respect of this site which propose or imply works more than 3 metres below ground level, an increase in height or floor area must include TfL to prevent planning permission being granted for development that might be prejudicial to the subsequent delivery of Crossrail 2.

Since the 2015 Directions were confirmed the current alignment of Crossrail 2 has been the subject of ongoing review and the latest proposal, shown below, are for the Mk.20.1 alignment which has moved the running tunnels slightly east of the above site. The purple lines show the centrelines of each of the two running tunnels.

Given the distance between the Crossrail 2 running tunnels and the site, in the event an application for planning permission were to be submitted I would still expect TfL to be notified of the proposals. Your email speaks about modifications to the existing building and, depending on the nature of the works and whether any below ground works are proposed, TfL may recommend to the local planning authority its Crossrail 2 conditions relating to ground movement and noise and vibration be attached to a grant of planning permission. If we do recommend conditions

the Crossrail 2 information for Developers guidance document provides further advice on how these may be discharged in conjunction with the local planning authority.

I am happy to meet but don't necessarily see there being an immediate need unless you would like to share the proposals in more detail.

Regards,

Michael Johnson BSc. Hons BTP MRTPI Safeguarding Manager Crossrail 2 Investment Delivery Planning Transport for London

### TfL RESTRICTED

From: Henry Tayler <<u>Henry.Tayler@arup.com</u>>
Sent: 07 October 2023 10:00
To: Crossrail2 <<u>Crossrail2@tfl.gov.uk</u>>; Safeguardcrossrail2 <<u>Safeguardcrossrail2@tfl.gov.uk</u>>;
Cc: G.Williams@Gardiner.com; j.pennell@gardiner.com; Marc Easton <<u>Marc.Easton@arup.com</u>>
Subject: Euston Tower, 286 Euston Road, London. Crossrail 2 Safeguarding

For attention of the safeguarding manager, Crossrail 2-TfL.

This correspondence is to request details of TfL Crossrail 2 safeguarding in proximity to the above site and to make initial contact with the safeguarding manager in relation to proposed feasibility studies for modifications to the existing building and development of the site.

#### **Brief summary:**

On behalf of our client, British Land, Arup are carrying out structural/geotechnical studies for the 286 Euston Road, "Euston Tower" site, Euston Road, within the London Borough of Camden. The site is located at the corner of Euston Road and Hampstead Road and the existing 1960s constructed Euston Tower building and associated 2 storey podium structure are located within the Regents Place /former Euston Centre development. The existing 36 storey 1960s constructed Euston Tower building has a single level basement and is founded on deep piled foundations.

### Existing TfL engagement.

The project team have held initial screening sessions with TfL related to the public realm and highways aspects of the proposal since April 2023.

The lead contact for engagement within TfL related to this scheme is Nahuel Mainard-Sardon. The project team are in contact with TfL/LUL Infrastructure Protection in relation to tube assets adjacent to the site, the lead contact within TfL is Lydia Wong.

### **Crossrail 2 safeguarding:**

An extract from the Crossrail 2 safeguarding directions is provided below, showing the location of the existing Euston Tower building in blue.

The Euston Tower and associated basement surrounding the tower is shown as located within the limited of land subject to consultation (safeguarding limits).

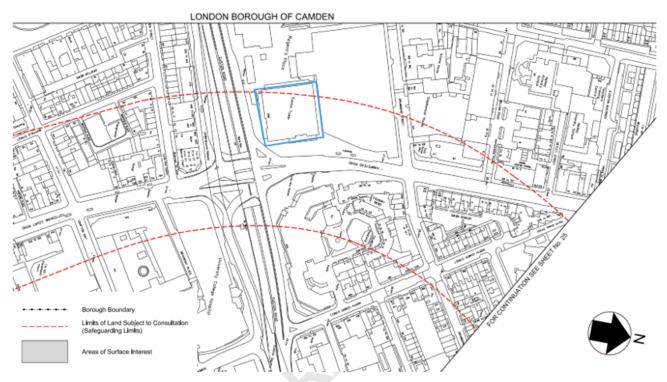

Figure 14 - Crossrail 2 safeguarding directions Sheet No24. March 2015. [MMD-307346-C-DR-SG-XX-1124]

An extract from the Crossrail2 interactive webmap is below, also showing the location of the existing Euston Tower building in blue.

<u>https://cr2.maps.arcgis.com/apps/webappviewer/index.html?id=21a7f72dfd0c443db5733bd81a707a67</u> The Euston Tower site falls within the Crossrail 2 safeguarding limits, however we note that the proposed tunnel alignment, shown in brown, falls outside the safeguarding limits to the east.

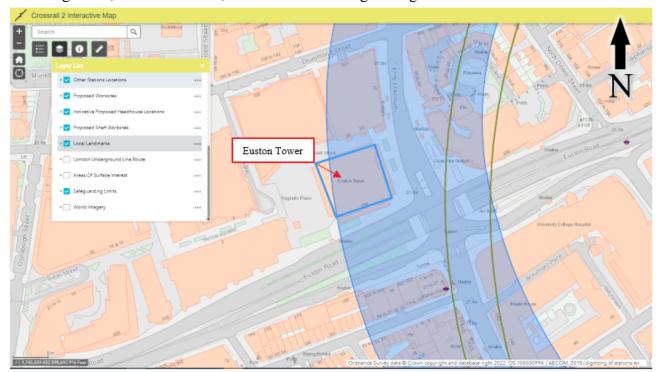

Figure 15 - Crossrail 2 safeguarding map extract – accessed 13/1/2023.

The team are aware of the guidance information available on <u>https://crossrail2.co.uk/discover/safeguarding/</u> and the associated "Information for Developers" guidance - CRL2-CRL2-GEN-ROUTWID-NOT-LP-00003. The team request details of the latest safeguarding arrangements, tunnel alignment and exclusion zones to inform engineering assessment at the site and ahead of a Planning Application.

We would like to arrange an initial meeting to discuss the current feasibility proposals and establish the requirements for further studies or submissions.

Please let us know if we can provide any further information to assist in this enquiry. Our contact details are given below.

Kind regards,

Henry

Appendix F – TfL Infrastructure Protection correspondence

From: Location Enquiries
Sent: Wednesday, January 17, 2024, 10:56 AM
To: David Fowler; Planning
Subject: RE: Consultee letter for Planning Application: 2023/5240/P

FAO David Fowler,

### Application No: 2023/5240/P

**Site address:** Euston Tower 286 Euston Road London NW1 3DP **Proposal:** Redevelopment of Euston Tower comprising retention of parts of the existing building (including central core, basement and foundations) and erection of a new building incorporating these retained elements, to provide a 32-storey mixed-use building providing offices and research and development floorspace (Class E(g)) and office, retail, café and restaurant space (Class E) and learning and community space (Class F) at ground, first and second floors, and associated external terraces; public realm enhancements, including new landscaping and provision of new publicly accessible steps and ramp; short and long stay cycle storage; servicing; refuse storage; plant and other ancillary and associated work

Thank you for your consultation.

Though we have no objection in principle to the above planning application, there are a number of potential constraints on the redevelopment of a site situated close to railway infrastructure. Therefore, it will need to be demonstrated to the satisfaction of TfL Infrastructure Protection engineers that:

- our right of support is not compromised;
- the development will not have any detrimental effect on our structures either in the short or long term;
- the design must be such that the loading imposed on our structures is not increased or removed;
- we offer no right of support to the development or land.

Therefore, we request that the grant of planning permission be subject to the following separate numbered conditions to be discharged in a phased manner as and when they are completed.

1. Before the pre-commencement/demolition stage begins, no works shall be carried out until the following, in consultation with TfL Infrastructure

Protection, have been submitted to and approved in writing by the local planning authority.

- a) provide an overview of the overall development including both design on temporary and permanent works;
- b) provide demolition details;
- c) accommodate the location of the existing London Underground structures and roads;
- d) accommodate ground movement arising from the development construction thereof;
- e) mitigate the effects of noise and vibration arising from the adjoining railway operations and roads;
- f) provide details on the use of tall plant/scaffolding for the demolition phase;
- g) No claims to be made against TfL or London Underground by the Local Authority, purchasers, tenants, occupants or lessees of the development for any noise or vibration resulting from London Underground running, operating and maintaining the adjacent railway.

2. Before the sub-structure construction stage begins, no works shall be carried out until the following, in consultation with TfL Infrastructure Protection, have been submitted to and approved in writing by the local planning authority.

- a) provide detailed design for foundations, basement and ground floor structures, or for any other structures below ground level, including piling (temporary and permanent);
- b) site specific Risk Assessments and Method Statements (RAMS) for any activities (basement excavation, groundworks, piling) which TfL may deem to be a risk to LU. Individual RAMS should be issued a minimum of 6 weeks prior to the individual activity commencing.

3. Before the super-structure construction stage begins, no works shall be carried out until the following, in consultation with TfL Infrastructure Protection, have been submitted to and approved in writing by the local planning authority.

- a) provide detailed design for all superstructure works (temporary and permanent);
- b) site specific Risk Assessments and Method Statements (RAMS) for any activities (craneage, scaffolding, use of tall plant) which TfL may deem to be a risk to LU. Individual RAMS should be issued a minimum of 6 weeks prior to the individual activity commencing.

The development shall thereafter be carried out in all respects in accordance with the approved design and method statements, and all structures and works comprised within the development hereby permitted which are required by the approved design statements in order to procure the matters mentioned in paragraphs of this condition shall be completed, in their entirety, before any part of the building hereby permitted is occupied.

**Reason:** To ensure that the development does not impact on existing London Underground transport infrastructure, in accordance with London Plan 2021, draft London Plan policy T3 and 'Land for Industry and Transport' Supplementary Planning Guidance 2012

This response is made as Railway Infrastructure Manager under the "Town and Country Planning (Development Management Procedure) Order 2015". It therefore relates only to railway engineering and safety matters. Other parts of TfL may have other comments in line with their own statutory responsibilities.

Kind regards,

### Tom Li

Safeguarding Engineer (LU+DLR) | Infrastructure Protection 5 Endeavour Square | 7<sup>th</sup> Floor Zone B | Westfield Avenue | E20 1JN

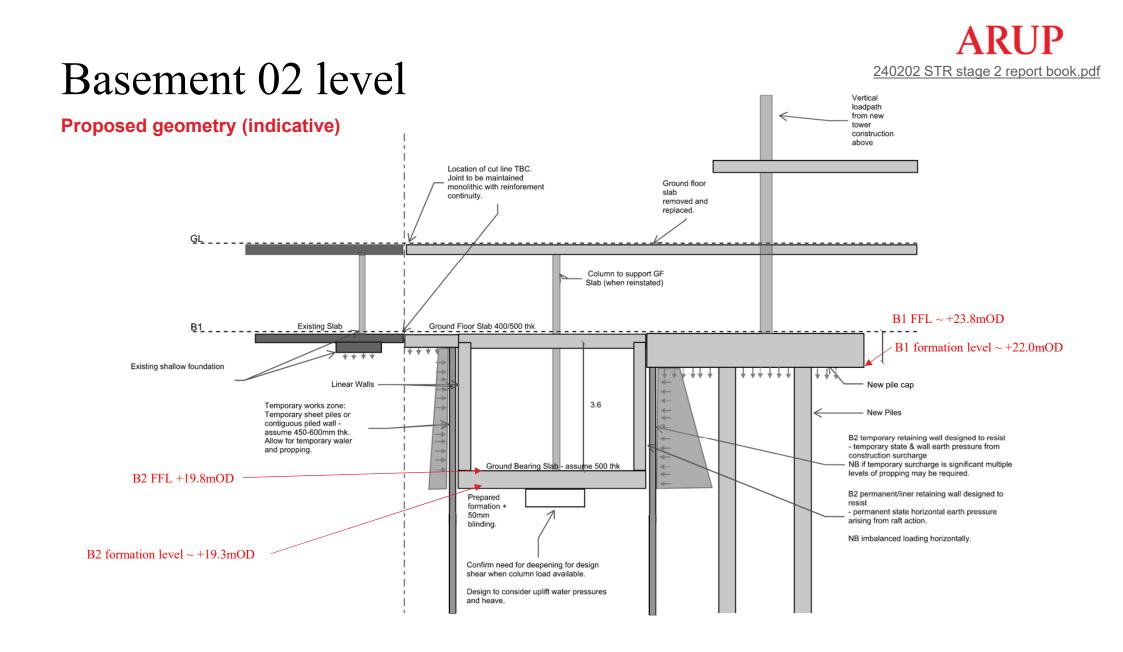

### Appendix G – Proposed B2 retaining wall calculations

# Euston Tower BIA (P05): Frew analysis

**David Foo** 

25 November 2024

# Basement 02 level

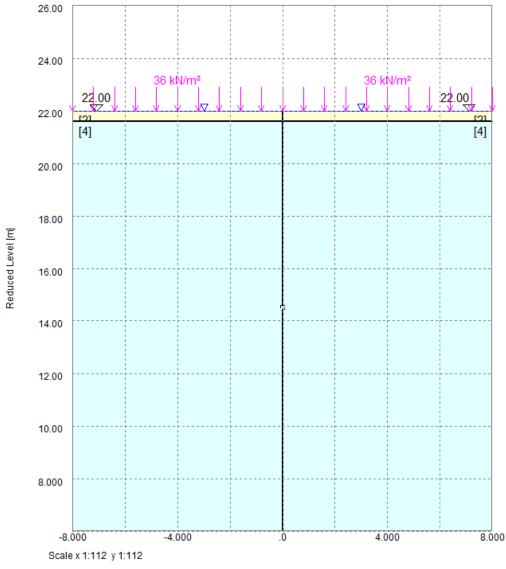

### Future B1 slab pressure (TBC)

Loads	Value
B1 permanent surcharge	45 kPa
B1 variable surcharge	10 kPa

# Frew

### **Frew model**

STAGE 0 : Initial condition

# Frew

### Stages

Stages	Description
0	Initial condition
1	Install wall
2	Cast B1 slab
3	Partial excavation to +20.5mOD
4	Install temporary prop at +22.4mOD
5	Excavation to FL+19.3mOD (for ULS check – unplanned excavation 0.5m included)
6	Cast B02 slab_wet concrete
7	Cast B02 slab
8	Cast B1 roof slab
9	Remove temporary prop
10	Long term soil condition
11	Concrete relaxation

# Frew

٠

### Ground model

Groundwater level taken at +22mOD. Assume provision of temporary groundwater control.

Stratum	Top of stratum level (mOD)	Unit weight (kN/m3)	Undraine d shear strength, Cu (kPa)	Effective angle of shearing resistance (°)	Undrained Young's modulus, Eu (kPa)	Drained Young's modulus, E' (kPa)	Ко	Delta/ phi	Cw/ Cu	Kr (Und)	Kr (Dr)
London Clay (weathered)	+22.0	20	60	24 (assumed)	60,000 (E <sub>u</sub> =1000C <sub>u</sub> )	45,000 (E'=750C <sub>u</sub> )	1.00	-	0.5	1.00	0.25
London Clay Formation	+21.6	20	80 + 5z	24 (assumed)	80,000+5,000z (E <sub>u</sub> =1000C <sub>u</sub> )	60,000+3,750z (E'=750C <sub>u</sub> )	1.00	-	0.5	1.00	0.25

## Frew

### Wall stiffness

- Piled wall bending stiffness (EI) calculated as follows:
  - Short term EI = $0.7E_0I$ , where  $E_0 = 34$ GPa (for C32/40 concrete assumed)
  - Long term  $EI = 0.5E_0I$ , (modelled through 30% relaxation of stiffness on short term)

Pile diameter (m)	Pile spacing (m)	I (m^4/m run)	EI/m short term (kNm^2 / m run)	EI/m long term (kNm^2 / m run)
0.6 (assumed)	1.20	0.0053 (0.00636 for single pile)	126,140	90,100

• Liner wall contribution ignored and not modelled in Frew.

## Frew

### **Prop stiffness**

- Temporary prop (TP1) stiffness assumed to be 40,000 kN/m/m
- Permanent slab stiffness approximated as follows:
  - B1 slab assumed 0.4m thick
  - B2 base slab assumed 0.5m thick
  - Rotational restraint due to propping slabs ignored

Slab type	Thickness (m)	<i>E</i> <sub>0</sub> (GPa)	Free length, L (m)	EA/L (kN/m/m)	0.5 EA/L (kN/m/m) Long-term
B1 slab	0.40	34 (for C32/40 concrete)	3.75 (assume 7.5m wide symmetrical excavation)	3,626,667	1,813,334
B2 base slab	0.50	34 (for C32/40 concrete)	3.75 (assume 7.5m wide symmetrical excavation)	4,533,333	2,266,667

# Frew

### Prop and wall levels

Scenario considered	Formation level (mOD)	Excavation depth to formation (m)	Temporary prop (TP) levels (mOD)	Permanent slab centre levels (mOD)	Contiguous wall diameter (m) & spacing (m)	Contiguous pile toe level (mOD)
Proposed Basement 02 level	+19.30	22.0-19.3 = 2.7	TP1 at +22.4	B1 slab at +23.6 B2 slab at +19.55	600mm dia. at 1.2m c/c	+14mOD (8m long contig pile)

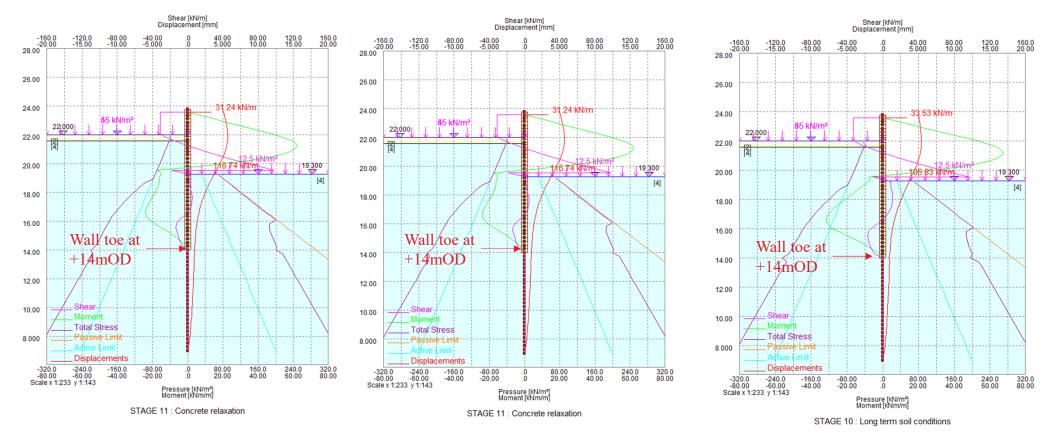

# Frew

### Surcharge

- A variable surcharge of 10 kPa adopted during construction on the active side of the wall.
- Future B1 raft permanent and variable surcharges behind the wall are taken to be 45 kPa and 10 kPa respectively.

# Frew

### **SLS Results**

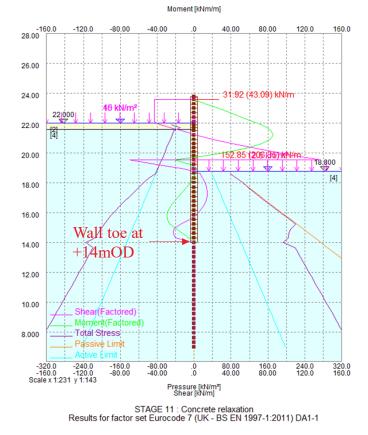

SLS Max Disp: 5.7mm at +21.9mOD

SLS Max SF: 98 kN/m at +19.6mOD

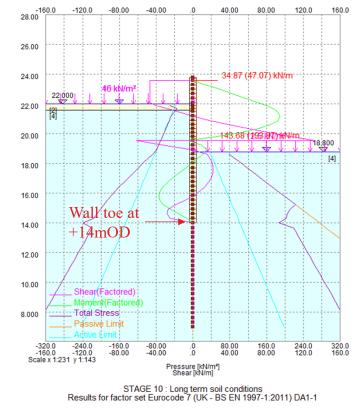

SLS Max BM: 67 kNm/m at +21.3mOD

# Frew

### **DA1C1 Results**

DA1C1 Max SF: 136 kN/m (164kN/pile) at +19.6mOD

Moment [kNm/m]

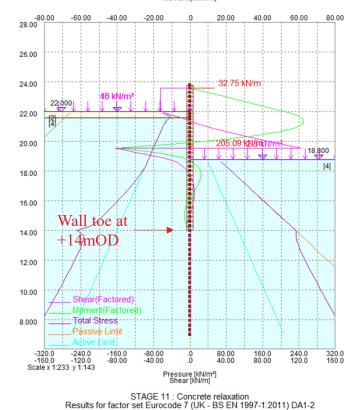

DA1C1 Max BM: 95 kNm/m (114kNm/pile) at +21.2mOD

# Frew

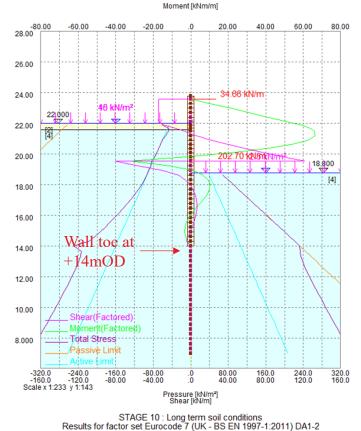

### **DA1C2 Results**

Moment [kNm/m]

DA1C2 Max SF: 123 kN/m (148kN/pile) at +19.6mOD

DA1C2 Max BM: 66 kNm/m (80kNm/pile) at +21.2mOD

Job number	281835
Job title	Euston Tower
Calculation heading	Basement 02 contig pile
By	DF

### 1 Units

The following units are used throughout this calculation.

Force	kN	Density	t/m <sup>3</sup>
Length	m	Area	mm <sup>2</sup>
Section dimensions	mm	Second moment of area	$\mathrm{mm}^4$
Stress	N/mm <sup>2</sup>	Section modulus	mm <sup>3</sup>
Strain	‰	Area per unit length	mm <sup>2</sup> /m
Moment	kNm	Angle	0
Curvature	‰/m	Axial stiffness	kN
		Bending stiffness	kNm <sup>2</sup>

### 2 Design code

The following design code is used: Eurocode 2 (part 1), National Annex: UK

### 3 Materials

The following materials are used in these calculations.

### 3.1 Concrete

• C32/40 -no permanent casing

to no permanent easing				
Strength, f <sub>ck</sub> :	32 N/mm <sup>2</sup>			
Elastic modulus, E:	33346 N/mm <sup>2</sup>			
Density, ρ:	2.4 t/m <sup>3</sup>			

### 3.2 Reinforcement

• 500B

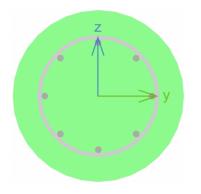

Strength,  $f_{yk}$ :500 N/mm²Elastic modulus, E:200e3 N/mm²

Density, p:

7.85 t/m<sup>3</sup>

### 4 Sections

### 4.1 Section 1 (Circular RC column)

Definition		Reinforcement	
Material	Concrete	Туре	Description
Grade	C32/40 -no permanent casing	LINK	B12
Profile	STD C 520	PERIMETER	8B20
Cover	75mm		

### 4.1.1 Analysis

#### 4.1.1.1 ULS Results Summary

Case	$F_x$ (kN)	$M_{yy}$ (kNm)	$M_{zz}$ (kNm)	Utilisation	Status
1	-22	114	0	62%	~

### 4.1.1.2 SLS Results Summary

Case	$F_x$	$M_{yy}$	$M_{ZZ}$	Cracked?	Crack width	EA	EI <sub>yy</sub> (kNm <sup>2</sup> )	$EI_{zz}$
	(kN)	(kNm)	(kNm)		(mm)	(kN)	(KINM-)	(KINM <sup>-</sup> )
1	-22	114	0	CRACKED	0.5831	-33460.7	22355.21	0

## **Analysis Options**

### General

Global Poisson's ratio: 0.50 Maximum allowable ratio between values of E: 1.5 Horizontal rigid boundary level: -20.00 [m OD] Displacements at load centroids: Yes GSA piled raft data : No

#### Elastic

Elastic : Yes

### Consolidation

Consolidation : No

### Soil ProfilesSoil Profile 1
